

4th February 2021

ASX Announcement

Up to 2.62% Cobalt and 7.44% Copper compliment excellent Gold results from drilling at Carlow Castle

Highlights

Further assays received from the 2020 42-hole, multi-rig drilling campaign at the Carlow Castle Gold Copper Cobalt Project.

New Carlow Deep “Feeder Zone” drill holes 20CCAD007 and 008W

- 7m @ 1.08g/t Au, 0.92% Cu, 1.03% Co from 618m in 20CCAD008W, including 2m @ 3.18g/t Au, 2.04% Cu, 2.62% Co from 619m.
- 3m @ 0.74g/t Au, 0.14% Cu, 1.25% Co from 575m.
- 4m @ 2.27g/t Au, 1.27% Cu, 0.38% Co from 504m in 20CCAD007, including 1m @ 8.07g/t Au, 3.56% Cu, 0.80% Co from 505m.

Resource area infill diamond hole 20CCAD010

- 8m @ 5.63g/t Au, 3.87% Cu, 0.21% Co from 122m in 20CCAD010, including 3m @ 11.62g/t Au, 7.44% Cu, 0.35% Co from 127m; and
- 17m @ 2.13g/t Au, 1.16% Cu, 0.36% Co from 141m, including 5m @ 5.05g/t Au, 1.25% Cu, 1.25% Co from 150m.

These latest drill results demonstrate that high grade gold, copper and cobalt is being routinely discovered at Carlow Castle, with exceptional combined metal content at Carlow Deep.

The Carlow Castle 10,000m 2021 RC drill campaign is approximately 50% complete (23 of 35 planned holes), targeting step-out, new discovery zones, and resource extensions.

Artemis Resources Limited (“Artemis” or “the Company”) (ASX:ARV, Frankfurt: ATY, US OTCQB: ARTTF) is pleased to provide an update on drill programmes currently underway at its 100%-owned Carlow Castle Gold and Copper Project in the west Pilbara region of Western Australia.

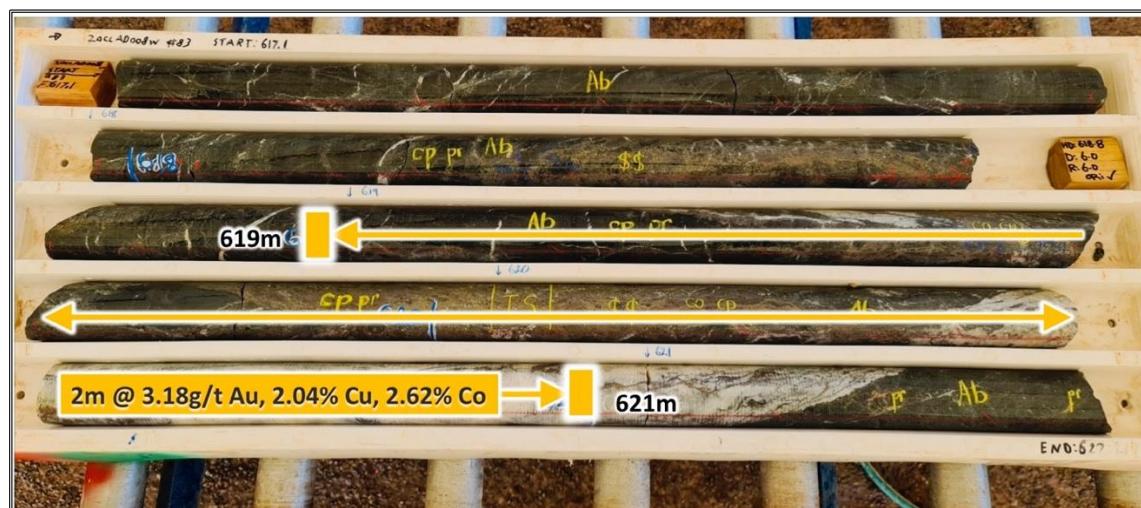

Figure 1: Uncut diamond drill core from hole 20CCAD008W targeting Carlow Deeps. Logged matrix to semi-massive Chalcopyrite, Cobaltite and Pyrrhotite and Pyrite. Final assay results and interval overlain.

Alastair Clayton, Executive Director commented: “Given the strength of the Gold grades being reported from our drill campaign, it is sometimes easy to overlook the exceptional Copper and Cobalt grades at Carlow.

“With Copper trading near 5-year highs at ~US\$7,850/t and Cobalt fetching ~US\$41,250/t, more than twice that of Nickel, the possible economic contribution of these metals to any future development at Carlow has the potential to be significant.

“As both metals are keenly sought after to support the booming global electric vehicle (EV) market, Carlow may present itself as a Western Australian supplier of Copper and Cobalt to global markets.

“At Carlow Deeps, all three holes targeting mineralisation up to 250m vertically below the existing resource shells to extend known mineralisation from surface to nearly 500mRL were successful.

“Carlow Deeps is a large target area comprising a near vertical E-W striking panel of mineralisation interpreted to be a chilled or feeder zone beneath the 1.2km strike of the Carlow resource area.

“Thus far we have two holes on section 507540E and another 120m to the west. We intend to keep drilling Carlow Deeps vertically to 500mRL and along strike to the east and west with the goal of proving up a substantial resource.

“There are still more assays from our Q4 2020 programme due soon and our 10,000m, as our 2021 RC drill programme nears the halfway point.”

Summary of Drilling at Carlow Castle

Drilling at Carlow Castle remains ongoing, with results from the 2020 RC and diamond drilling continuing to come in. Most recent results are highlighted in **Figures 4, 5** and **Table 1**, which highlights significant intercepts to date and the number of pending assays.

These assay results clearly confirm the Carlow mineralised system continues to depth with multiple intersections over approximately 150m of strike length 500m below surface. Figure 3 shows a simple scatterplot of gold values >0.5g/t Au (yellow) and >1g/t Au (red).

Significantly the intersections at depth show major high-grade Cobalt values, especially in 20CCA008W, highlighting the continued variation/zonation within the deposit.

The sections in **Figures 4 & 5** show the deep intersections are in the appropriate downdip position to form a continuous zone of mineralisation with shallow drilling; this will require significant intermediate drilling from the south to better define the intervening zone.

~5,000m of the 10,000m RC drilling programme has been completed, targeting step out drilling, the new Discovery Zone and resource extension (23 of 35 planned holes). A portion of this programme is allotted to test targets generated from the IP survey currently in process. Both IP survey and the drilling programme have been placed on hold until the current weather event passes and conditions improve.

Once RC drilling resumes several holes will be repurposed to test the Discovery Zone on an NW-SE orientation; the traverses will be extended to investigate the secondary target zone to the west. This zone potentially explains the presence of several minor mineralised zones intersected in drilling to the east of Quod Est and the presence of several historical pits and shafts along the trend.

Once the diamond drilling and assaying is completed, consultants CSA Global will complete an updated structural model for the Carlow Castle deposit and resource estimation.

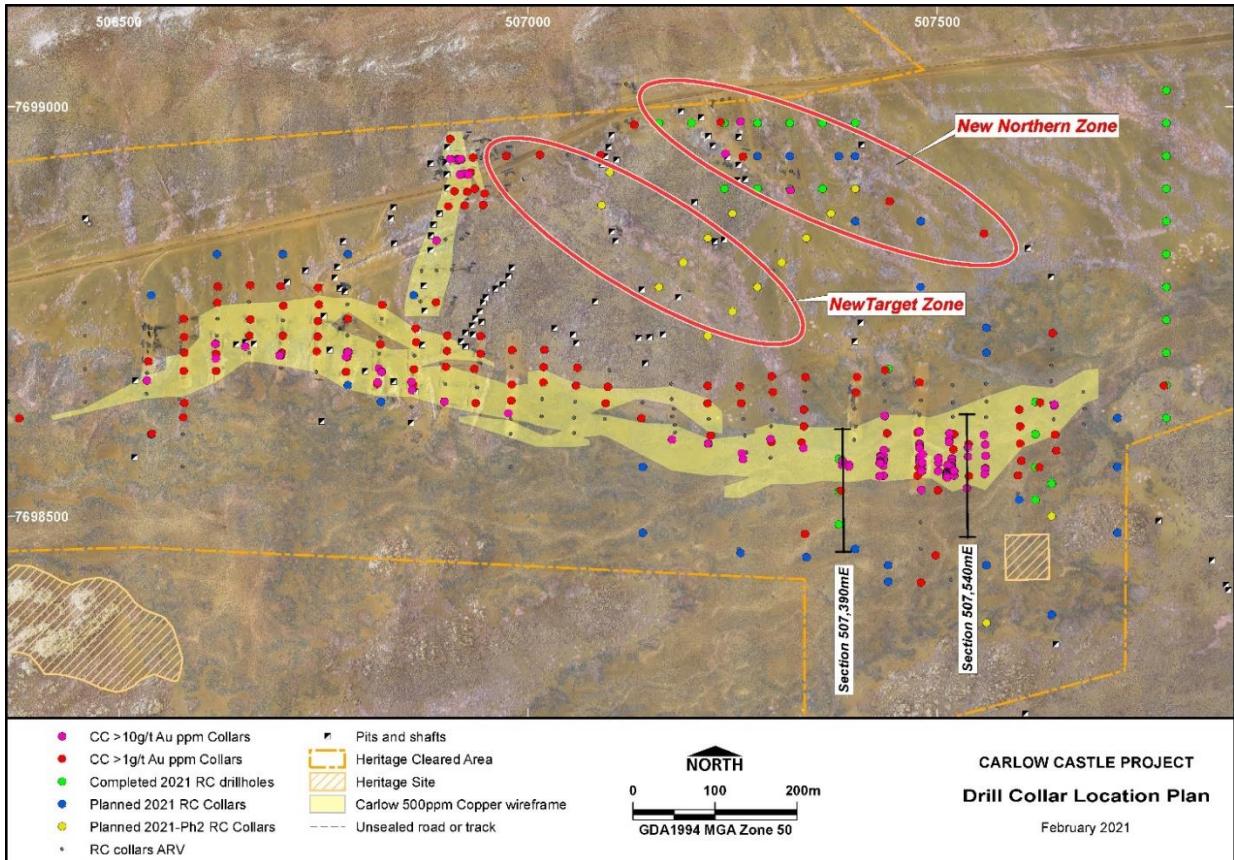

Figure 2: Carlow Castle current drilling programme map showing current reverse circulation (RC) hole locations, with previous drill and 2019 inferred Mineral Resource Estimate (MRE) schematic outline (as released to the ASX on 20 November 2019), with the location schematic drill cross sections 507390mE and 507540mE +/-10m shown, and as cross sections in Figures 4 and 5 below. The outlined areas show the new Northern Discovery Zone and new target zone.

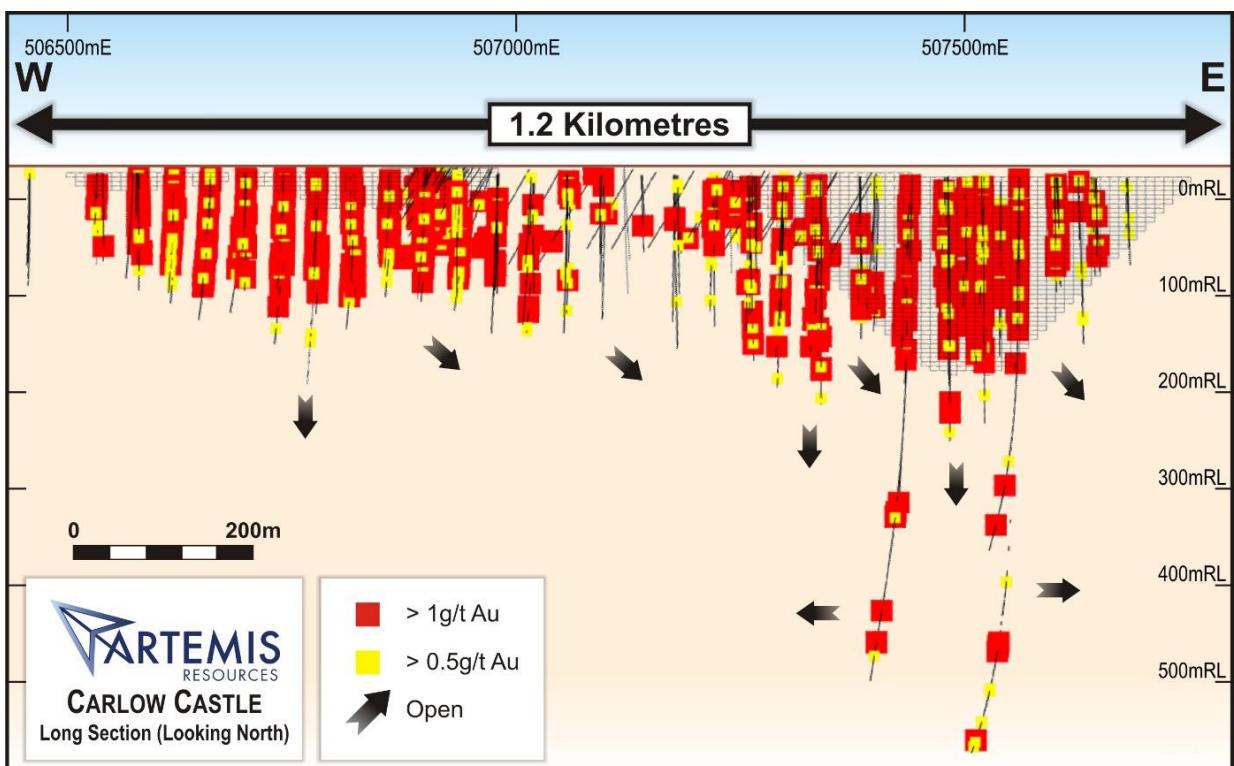

Figure 3: Carlow Castle 2D Longitudinal section with all gold point values projected orthogonally. Values >0.5g/t Au yellow, values >1g/t Au red. Pit outlines are from the 2019 inferred Mineral Resource Estimate (MRE) schematic outline (as released to the ASX on 20 November 2019). The long-section highlights extent of open potential between the current resource and the Carlow Deeps program.

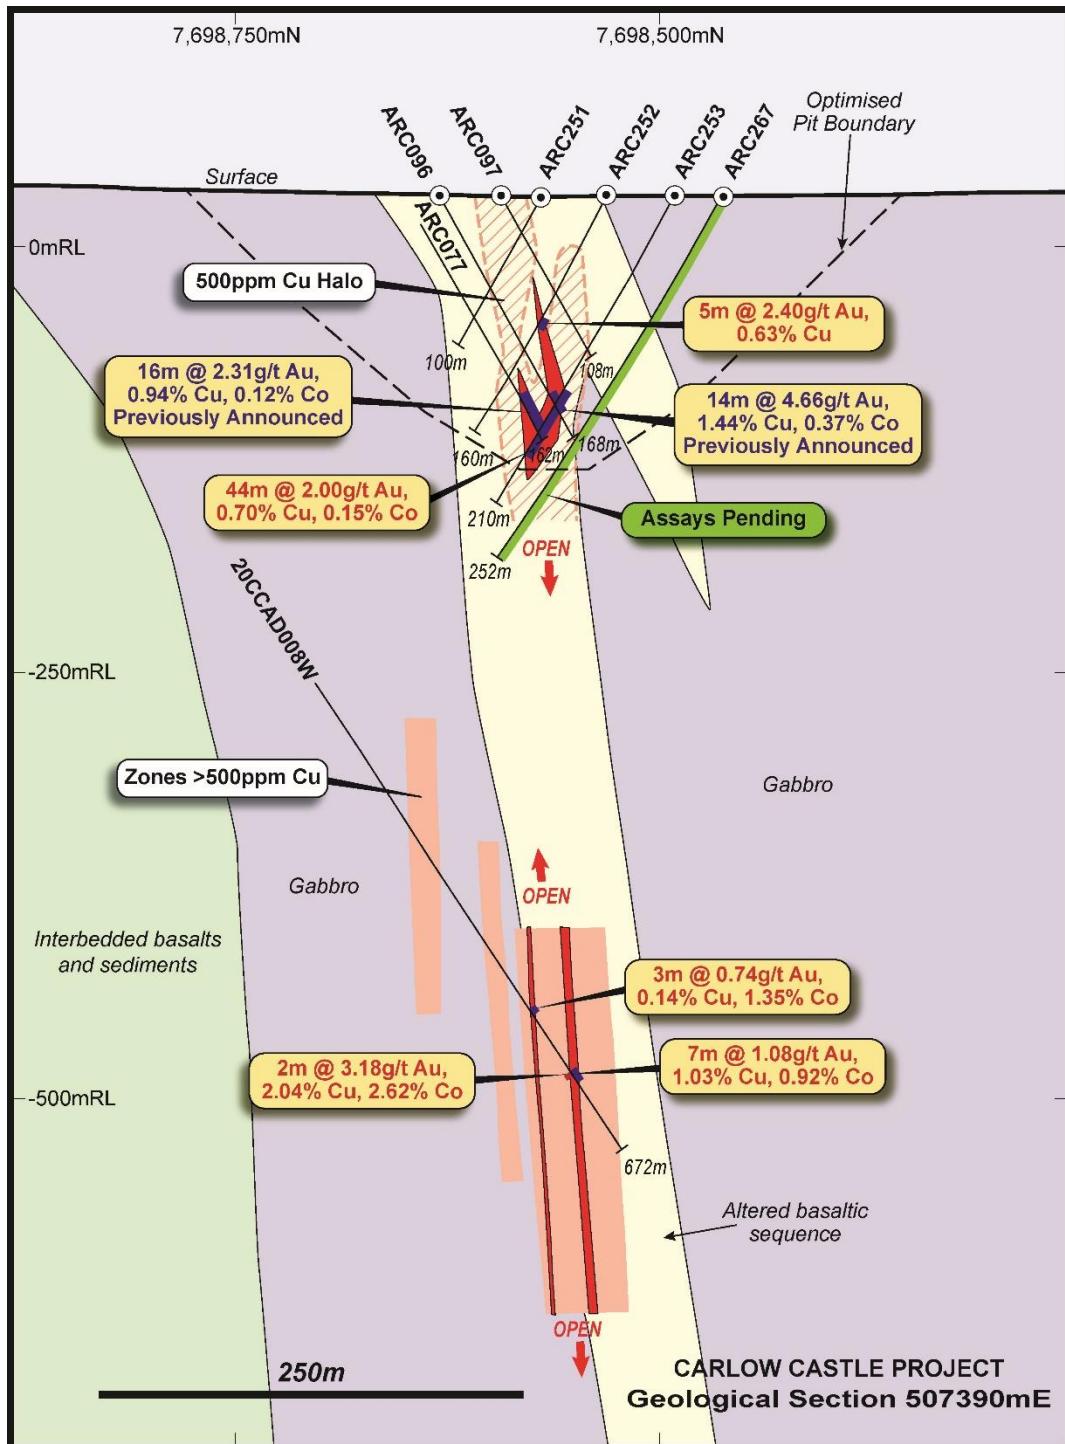

Figure 4: Carlow Castle current programme interpretive drill section 507390mE +/-10m showing recent intercepts from the Nov2020 RC drilling and deep diamond hole 20CCAD008W.

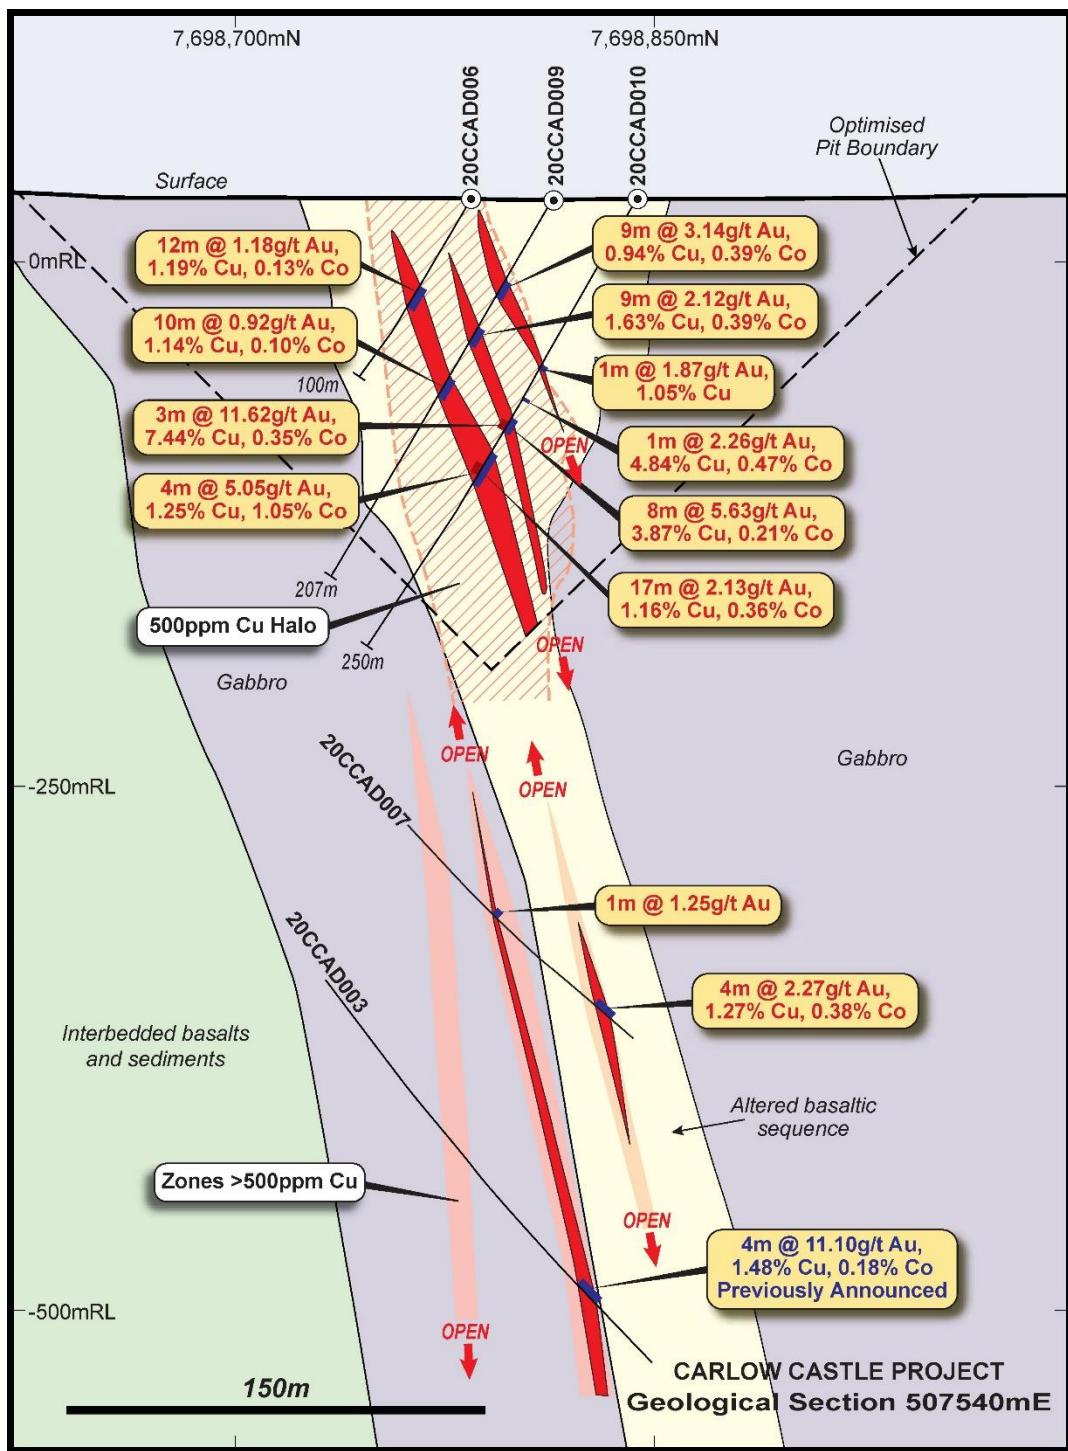

Figure 5: Carlow Castle current programme interpretive drill section 507540mE +/-10m showing recent intercepts from the Dec2020 Resource Infill diamond drilling and deep diamond holes 20CCAD003 and 20CCAD007.

COMPETENT PERSONS STATEMENT:

The information in this announcement that relates to Exploration Results and Exploration Targets is based on information compiled or reviewed by Allan Younger, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Younger is an employee of Artemis Resources Limited. Mr Younger has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Younger consents to the inclusion in the announcement of the matters based on his information in the form and context in which it appears.

About Artemis Resources

Artemis Resources (ASX: ARV; FRA: ATY; US: ARTTF) is a Perth-based exploration and development company, led by an experienced team that has a singular focus on delivering shareholder value from its Pilbara gold projects – the Greater Carlow Gold Project in the West Pilbara and the Paterson Central exploration project in the East Pilbara.

SECTION 1 SAMPLING TECHNIQUES AND DATA

(Criteria in this section apply to all succeeding sections.)

Criteria	Commentary
Sampling techniques	<ul style="list-style-type: none"> Reverse circulation drilling was used to obtain 1 m samples. Samples were collected on a 1m basis and stockpiled. The single metre samples of any composite sample reporting greater than 0.1g/t Au were retrieved and assayed. All samples were pulverized produce a 50 g charge for fire assay.
Drilling techniques	<ul style="list-style-type: none"> Reverse Circulation drilling by KTE Drilling. Diamond drilling by Topdrill.
Drill sample recovery	<ul style="list-style-type: none"> Drilling recoveries for Reverse circulation drilling were excellent, with all samples dry.
Logging	<ul style="list-style-type: none"> Artemis Reverse Circulation drilling has been logged; Diamond core processing is ongoing
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> The RC drilling rig was equipped with a rig-mounted cyclone and static cone splitter, which provided one bulk sample of approximately 20-30 kilograms, and a representative sub-sample of approximately 2-4 kilograms for every metre drilled. The sample size of 2-4 kilograms is appropriate and representative of the grain size and mineralisation style of the deposit.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> ALS (Perth) were used for all analysis of drill samples submitted by Artemis. The laboratory techniques below are for all samples submitted to ALS and are considered appropriate for the style of mineralisation defined within the Carlow Castle Project area: Samples above 3Kg riffle split. Pulverise to 95% passing 75 microns 50-gram Fire Assay (Au-AA26) with ICP finish - Au. 4 Acid Digest ICP-AES Finish (ME-ICP61) – Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Ga, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W, Zn. Ore Grade 4 Acid Digest ICP-AES Finish (ME-OG62) Standards were used for external laboratory checks by Artemis. Duplicates were used for external laboratory checks by Artemis.
Verification of sampling and assaying	<ul style="list-style-type: none"> Electronic data capture, storage and transfer as .csv. Routine QC checks performed by contractor and independent geophysical consultant. Data were found to be of high quality and in accordance with contract specifications Laboratory standards and blank samples were inserted at regular intervals and some duplicate samples were taken for QC checks.
Location of data points	<ul style="list-style-type: none"> A Garmin GPSMap62 hand-held GPS was used to define the location of the drill hole collars. Standard practice is for the GPS to be left at the site of the collar for a period of 5 minutes to obtain a steady reading. Collar locations are considered to be accurate to within 5m. Hole collars surveyed by licensed surveyors on completion of the drilling. Zone 50 (GDA 94).
Data spacing and distribution	<ul style="list-style-type: none"> Current drill hole spacing is variable and dependent on specific geological, and geochemical targets. No sample compositing has been used for drilling completed by Artemis. All results reported are the result of 1 metre downhole sample intervals.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Drill holes were designed to be perpendicular to the strike of known mineralisation. Due to the structural and geological complexity of the area, it is mineralisation of unknown orientation can be intersected.
Sample security	<ul style="list-style-type: none"> The chain of custody is managed by the supervising geologist who places calico sample bags in polyweave sacks. Up to 10 calico sample bags are placed in each sack. Each sack is clearly labelled with: <ul style="list-style-type: none"> Artemis Resources Ltd

Criteria	Commentary
	<ul style="list-style-type: none"> ○ Address of laboratory ○ Sample range ● Samples were delivered by Artemis personnel to the transport company in Karratha and shrink wrapped onto pallets. ● The transport company then delivers the samples directly to the laboratory.
Audits or reviews	<ul style="list-style-type: none"> ● Data is validated upon up-loading into the master database. Any validation issues identified are investigated prior to reporting of results.

SECTION 2 REPORTING OF EXPLORATION RESULTS

(Criteria listed in the preceding section also apply to this section.)

Criteria	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> ● Drilling by Artemis was carried out on E47/1797 – 100% owned by Artemis Resources Ltd. This tenement forms a part of a broader tenement package that comprises the West Pilbara Project. ● This tenement is in good standing.
Exploration done by other parties	<ul style="list-style-type: none"> ● The most significant work to have been completed historically in the Carlow Castle area, including the Little Fortune and Good Luck prospects, was completed by Open Pit Mining Limited between 1985 and 1987, and subsequently Legend Mining NL between 1995 and 2008. ● Work completed by Open Pit consisted of geological mapping, geophysical surveying (IP), and RC drilling and sampling. ● Work completed by Legend Mining Ltd consisted of geological mapping and further RC drilling. ● Legend also completed an airborne ATEM survey over the project area, with follow up ground-based FLTEM surveying. Re-processing of this data was completed by Artemis and was critical in developing drill targets for the completed RC drilling. ● Compilation and assessment of historic drilling and mapping data completed by both Open Pit and Legend has indicated that this data compares well with data collected to date by Artemis. Validation and compilation of historic data is ongoing. ● All exploration and analysis techniques conducted by both Open Pit and Legend are considered to have been appropriate for the style of deposit.
Geology	<ul style="list-style-type: none"> ● The Carlow Castle Co-Cu-Au prospect includes a number of mineralised shear zones, located on the northern margin of the Andover Intrusive Complex. Mineralisation is exposed in numerous workings at surface along numerous quartz rich shear zones. Both oxide and sulphide mineralisation are evident at surface associated with these shear zones. ● Sulphide mineralisation appears to consist of Chalcopyrite, chalcocite, cobaltite, pyrrhotite and pyrite
Drill hole Information	<ul style="list-style-type: none"> ● Drill hole information is contained within this release.
Data aggregation methods	<ul style="list-style-type: none"> ● All intervals reported are composed of 1 metre down hole intervals for Reverse Circulation drilling, and sample intervals are used for Diamond core are 1m intervals only and not length weighted. ● No upper or lower cut-off grades have been used in reporting results. ● No metal equivalent calculations are used in this report.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> ● True widths of mineralisation have not been calculated for this report, and as such all intersections reported are down-hole thicknesses. ● A better understanding of the deposit geometry will be achieved on thorough interpretation of the data. True thicknesses may be reported at a later date if warranted. Due to the moderately to steeply dipping nature of the mineralised zones, it is expected that true thicknesses will be less than the reported down-hole thicknesses.
Diagrams	<ul style="list-style-type: none"> ● Appropriate plans are shown in the text.

Criteria	Commentary
Balanced reporting	<ul style="list-style-type: none"> Reporting of results in this report is considered balanced.
Other substantive exploration data	<ul style="list-style-type: none"> Targeting for the RC drilling completed by Artemis was based on compilation of historic exploration data, and the surface expression of the targeted mineralised shear zones and associated historic workings.
Further work	<ul style="list-style-type: none"> The results at the Carlow Castle Co-Cu-Au project warrant further drilling. The drill programme results to date are considered excellent. An IP programme and detailed low level aeromagnetic survey are scheduled to be completed in the coming weeks.
