### 4.5 Mt of Cobalt/Copper/Gold JORC Resources at Carlow Castle - Karratha, Western Australia-

## Highlights:

- Significant increases in Carlow Castle JORC 2012 Resources.
- JORC 2012 compliant Indicated and Inferred resources at 0.05\% Co cutoff grade, have increased to 2.3 Mt @ $1.3 \mathrm{~g} / \mathrm{t} \mathrm{Au}, 0.11 \% \mathrm{Co}, 0.5 \% \mathrm{Cu}$ \& $1.6 \mathrm{~g} / \mathrm{t} \mathrm{Ag}$ within a global resource of $4.5 \mathrm{Mt} \mathrm{@} 0.9 \mathrm{~g} / \mathrm{t} \mathrm{Au}, 0.07 \% \mathrm{Co}$, $0.4 \% \mathrm{Cu} \& 1.3 \mathrm{~g} / \mathrm{t}$ Ag.
- Deposits remain open and further drilling is planned in Q1 to expand resources.
- Open Pit optimisation studies and scheduling have commenced.
- Carlow Castle is only 30 km north-east of Artemis's Radio Hill treatment plant.

## David Lenigas, Artemis' Executive Chairman, commented;

"We have seen a significant boost to tonnage in this latest resource estimate at Carlow Castle and we believe that this Project has the potential to be a significant new Cobalt province in Australia based upon recent exploration results. With the world cobalt prices now at US $\$ 79,750$ a tonne (LME, 26 Jan 2018) (~AUD $\$ 98,000$ a tonne), our Carlow Castle Project's potential is looking very attractive. These three deposits reported on today are only a few of the many high priority targets now identified by Artemis over $50 \mathrm{~km}^{2}$. Apart from plans to continue drilling to expand the resource base further, we have now engaged consultants to run a fast-track scoping study to assess the potential economics of processing this material through our nearby and soon to be re-commissioned Radio Hill treatment plant. The Radio Hill plant upgrades are progressing well, and we continue to receive interest from international "Cobalt trading houses" for Artemis's conflict-free Cobalt."

Artemis Resources Limited ("Artemis") (ASX: ARV) is pleased to provide a further update to the JORC Code (2012) compliant resource estimates for its $100 \%$ owned Carlow Castle Project, which includes Quod Est, Carlow Castle South and Carlow Castle South-East (Cobalt/Gold/Copper) Prospects, located about 20 km southeast of Karratha in the Western Pilbara Region of Western Australia.

Carlow Castle is located only 30 km north-east of Artemis' Radio Hill processing plant, via gazetted roads. Work has also commenced on converting the portion of Exploration Licence E47/1797 covering the deposits to Mining Leases. A diamond drilling programme is planned for geotechnical analysis for detailed open pit planning purposes and for advanced metallurgical recovery optimisation and plant operating cost planning.
The refurbishment and upgrade work at the Radio Hill Plant are progressing well. The Company is progressing towards having the planned works, which includes the
addition of a 70-100 tonne per hour gravity gold recovery circuit to the current sulphide processing circuit, completed and fully operational by the end of June 2018.

Figure 1: Carlow Castle Project areas and geology.

Al Maynard \& Associates ("AM\&A") estimated a total Indicated and Inferred resource (Table 1) of the Carlow Castle Project, within the lode wireframes of Quod Est, Carlow Castle South and Carlow Castle South-East, which are based on 0.5 metal content lower cut-off of 4,500,000 tonnes at $0.9 \mathrm{~g} / \mathrm{t} \mathbf{A u}$ $\mathbf{0 . 0 7 \%} \mathrm{Co}, \mathbf{0 . 4 \%} \mathrm{Cu} \& 1.3 \mathrm{~g} / \mathrm{t} \mathbf{A g}$. The Quod Est resource parameters were released to the ASX on the $22^{\text {nd }}$ January ${ }^{1}$.

Table 1: Global Resource estimate for Carlow Castle Project, which includes Quod Est ${ }^{1}$, Carlow Castle South and Carlow Castle South-East Lode (Phil Jones, 2018; AM\&A).

| Description | Category | Million Tonnes | $\mathrm{Au}(\mathrm{g} / \mathrm{t})$ | Co (\%) | Cu (\%) | $\mathrm{Ag}(\mathrm{g} / \mathrm{t})$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Carlow Castle South | Inferred | 3.2 | 0.9 | 0.06 | 0.4 | 1.3 |
| Carlow Castle South-East Lode | Inferred | 0.7 | 1.2 | 0.06 | 0.4 | 1.8 |
| Quod Est | Indicated | 0.3 | 1.2 | 0.21 | 0.5 | 1.4 |
| Quod Est | Inferred | 0.2 | 0.6 | 0.07 | 0.3 | 1.0 |
| TOTAL | Indicated | 0.3 | 1.2 | 0.21 | 0.5 | 1.4 |
| TOTAL | Inferred | 4.2 | 0.9 | 0.06 | 0.4 | 1.3 |
| TOTAL | Indicated +Inferred | 4.5 | 0.9 | 0.07 | 0.4 | 1.3 |

Considering the potential commercial value of all three elements and the proximity to the Company's processing plant at Radio Hill and the preliminary metallurgical testwork results previously announced in ASX announcement 19 th June 2017 "Cobalt Metallurgy Tests Prove Positive Carlow Castle Project", the project warrants detailed, systematic assessment. The orebody is shallow and diamond drilling for geotechnical pit optimisation is about to begin, along with further metallurgical studies.

| ---: | ---: | ---: | ---: | ---: | ---: | ---: |

## New Additional Resources at Carlow Castle South and Carlow Castle South-East:

Al Maynard \& Associates ("AM\&A") estimate for Carlow Castle South and Carlow Castle South-East a total resource (Table 3) within the lode wireframes (Figure 2) which are based on a generic 0.5 metal content lower cut-off calculated by ( $\mathrm{Aug} / \mathrm{t}+\mathrm{Cu} \%+10^{*} \mathrm{Co} \%$ ) of 3,900,000 tonnes at $\mathbf{0 . 9} \mathbf{g} / \mathrm{t} \mathbf{A u}, \mathbf{0 . 0 6 \%}$ Co, $\mathbf{0 . 4 \%} \mathrm{Cu} \& 1.4 \mathrm{~g} / \mathrm{t} \mathrm{Ag}$, made up of an Inferred resource of approximately 3,200,000 tonnes at 0.9 $\mathrm{g} / \mathrm{t} \mathrm{Au}, 0.06 \% \mathrm{Co}, 0.4 \% \mathrm{Cu}, 1.3 \mathrm{~g} / \mathrm{t} \mathrm{Ag}$ at Carlow Castle South and an Inferred resource of approximately 700,000 tonnes at $1.2 \mathrm{~g} / \mathrm{t} \mathrm{Au}, 0.06 \% \mathrm{Co}, 0.4 \% \mathrm{Cu} \& 1.8 \mathrm{~g} / \mathrm{t} \mathrm{Ag}$ at Carlow Castle South-East.

Table 3: AM\&A Resource estimate for Carlow Castle South and Carlow Castle South-East Lode. (Phil Jones, 2018).

| Description | Category | Million <br> Tonnes | $\mathrm{Au}(\mathrm{g} / \mathrm{t})$ | Co (\%) | Cu (\%) | Ag (g/t) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Carlow Castle South | Inferred | 3.2 | 0.9 | 0.06 | 0.4 | 1.3 |
| Carlow Castle South-East Lode | Inferred | 0.7 | 1.2 | 0.06 | 0.4 | 1.8 |
|  |  |  |  |  |  |  |
| TOTAL | Inferred | 3.9 | 0.9 | 0.06 | 0.4 | 1.4 |

The same resource estimate at cut-off grades of $1.0 \mathrm{~g} / \mathrm{t} \mathrm{Au}, 0.05 \% \mathrm{Co}$ and at $1.0 \% \mathrm{Cu}$ is provided for comparison in Table 4:

Table 4: AM\&A Resource estimate at selected Au, Co and Cu lower cut-off grades for Carlow Castle South and
Carlow Castle South-East Lode (Phil Jones, 2018).

| Au Grade <br> Range | Million <br> Tonnes | $\mathbf{A u}(\mathrm{g} / \mathrm{t})$ | $\mathrm{Co}(\%)$ | $\mathrm{Cu}(\%)$ | $\mathbf{A g}(\mathrm{g} / \mathrm{t})$ |
| :---: | ---: | ---: | ---: | ---: | ---: |
| $>1.0$ | 1.3 | 1.7 | 0.09 | 0.5 | 1.8 |
| $<1.0$ | 2.6 | 0.5 | 0.05 | 0.4 | 1.1 |

| Co Grade <br> Range | Million <br> Tonnes | Au (g/t) | Co (\%) | Cu (\%) | Ag (g/t) |
| :---: | ---: | ---: | ---: | ---: | ---: |
| $>0.05 \%$ | 2.1 | 1.2 | 0.09 | 0.5 | 1.6 |
| $<0.05 \%$ | 1.9 | 0.5 | 0.03 | 0.3 | 1.0 |

| Cu Grade Range | Million <br> Tonnes | $\mathrm{Au}(\mathrm{g} / \mathrm{t})$ | Co (\%) | Cu (\%) | $\mathrm{Ag}(\mathrm{g} / \mathrm{t})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| >1.0\% | 0.1 | 1.6 | 0.15 | 1.4 | 3.8 |
| <1.0\% | 3.9 | 0.9 | 0.06 | 0.4 | 1.3 |

Note : Figures have been rounded and totals may vary due to small rounding errors.

Fifty-two (52) drillholes within Carlow Castle South indicate several potentially economic lodes (Figure 2) from surface to a current vertical extent of about 150 m .

Drill collar locations are listed in Table 5, significant drillhole intersections are listed in Table 6, Search Parameters applied in block model Table 7 and Significant Assays: $>0.5 \mathrm{~g} / \mathrm{t} \mathrm{Au},>1000 \mathrm{ppm}$ Co ( $0.1 \%$ ), $>5000$ ppm Cu (0.5\%) in Table 8.

The Cobalt/Gold/Copper mineralisation at the Carlow Castle Project is hosted in chloritic shear zones within the predominantly Archean mafic sequence. The ore zones appear partially oxidised above 20 m with sulphides extending to depth, the primary sulphides are chalcopyrite, cobaltite and pyrite; the presence of chalcocite in some samples indicates supergene enrichment in the upper portions of the sulphide zone.

The Carlow Castle Project (Figure 1) has 3 current deposits, with the southern deposits being in two (2) portions with a $450 \mathrm{~m} / 500 \mathrm{~m}$ gap between the areas, which is currently undrilled. Geochemical data indicates a degree of continuity between the areas but remains to be tested. (ASX announcement $20^{\text {th }}$ June 2017 High Grade Cobalt - 'Four New Targets Identified').

The structural environment of the area is complex; Carlow South strikes east-west and dips steeply to the north, whereas Quod Est strikes north-south and dips steeply to the east. Carlow Castle South-East is interpreted to strike east-west but very steeply to the south.

A detailed SAM (Sub Audio Magnetics) geophysical survey is in progress to assist with the interpretation of the structural system over the $50 \mathrm{~km}^{2}$ of newly identified Cobalt/Gold/Copper geochemical targets as per the Company's news release date 19 January 2018.
The Resource estimate was compiled by Mr. Philip Jones of AM\&A using MineMap® software. The modelling method is Inverse Distance Cubed confined by wireframes that follow the interpreted geology. This method does not smear the poddy high grades unduly and properly considers the interpreted geological controls on the mineralisation.
The mineralisation was digitised on cross sections, snapping to the drill intercepts, using a lower cutoff where the total of Au grams per tonne plus $\mathrm{Cu} \%$ plus $10 * \mathrm{Co} \%$ is $>0.5$. This generic metal content factor was used to define the mineralised envelope because the copper, cobalt and gold are strongly associated with each other and are all potentially economically recoverable.

Sample intervals within the interpreted lode below the designated 0.5 metal content were included within the lode wireframe where internal dilution did not drop the total intersection below 0.5 and where it provided improved continuity with other adjacent drill intersections of the lode.

The mineralised zones on each cross-section and long-section were then linked by wireframes to produce "solids" as per Figure 3. The base of oxidation was triangulated from the drill hole geology logs. Separate wireframes were produced for the Oxide and Primary zones in each of the mineralised shears.

This resource estimate was based on data supplied by Artemis Resources consisting of drill collar coordinates, down-hole surveys, down-hole lithology logs, down-hole density measurements, sample recovery data and assay data. The data was reviewed by AM\&A who found the quality of the drilling, sample collection and assays met all the expected industry standards.

A total of 2,431 density measurements (averaged over 1 m ) were collected from 52 of the Artemis drill holes using a downhole gamma/caliper/density/resistivity logger by Downhole Services Group. Of these measurements 295 were in mineralised intervals with $>0.5 \mathrm{~g} / \mathrm{t}$ Au. The average density of the 129 partially weathered mineralised measurements was 2.7 while the 118 fresh mineralised samples averaged 2.9. Because the less dense, strongly weathered mineralisation near to the surface was not measured due to the spacing of the drill collars, a conservative overall bulk density of 2.5 was used for weathered mineralisation and 3.0 for the fresh ore.

AM\&A having classified the mineralisation defined at Carlow South and Carlow South-east as Inferred Resources according to the JORC Code (2012). These extend over a strike length of 400 m at Carlow Castle South, drilled on a $40 \mathrm{~m} \times 20 \mathrm{~m}$ grid, and $80 \mathrm{~m} \times 20 \mathrm{~m}$ at Carlow Castle South-East.

Figure 2: Cross section of Carlow Castle South at $506820 \mathrm{mE}+/-5 \mathrm{~m}$ showing mineralised zones and significant intersections.

 with holes colour coded by generic metal content (Au ppm + Cu\%+10*Co\%).

## COMPETENT PERSONS STATEMENT:

The information in this document that relates to Resource estimation is based on information compiled or reviewed by Philip Jones, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Jones is a consultant to the Company, and is a consultant to Al Maynard \& Associates (AM\&A). Mr Jones has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Jones consents to the inclusion in the report of the matters based on his information in the form and context in which it appears

## COMPETENT PERSONS STATEMENT:

The information in this document that relates to Exploration Results and Exploration Targets is based on information compiled or reviewed by Allan Younger, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Younger is a consultant to the Company, and is employed by Indigo Geochemistry Pty Ltd. Mr Younger has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Younger consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

## Artemis' tenement package in the Karratha Region of Western Australia

## BACKGROUND INFORMATION ON ARTEMIS RESOURCES:

Artemis Resources Limited is a resources exploration and development company with a focus on its prospective Karratha (gold, cobalt, base metals, platinum group elements and iron ore) and the Mt Clement Paulsens (gold) project in Western Australia.

Artemis owns the fully permitted $\sim 500,000$ tpa Radio Hill nickel and copper operations and processing plant located 35 km south of Karratha. JORC Code 2004 compliant resources of gold, nickel, copper PGE's and zinc, all situated within a 40 km radius of the Radio Hill plant and on $1,838 \mathrm{~km}^{2}$ form the newly consolidated assets of Artemis Resources. Artemis is currently refurbishing and upgrading the Radio Hill processing plant and is targeting on having it operational in June 2018.

Artemis have signed Definitive Agreements with Novo Resources Corp. ("Novo"), which is listed on Canada's TSX Venture Exchange (TSXV:NVO), and pursuant to the Definitive Agreements, Novo has satisfied its expenditure commitment, and earned $50 \%$ of gold (and other minerals necessarily mined with gold) in conglomerate and/or paleoplacer style mineralization in Artemis' tenements within 100 km of the City of Karratha, including at Purdy's Reward ("the Gold Rights"). The Gold Rights do not include (i) gold disclosed in Artemis' existing (at 18 May 2017) JORC Code Compliant Resources and Reserves or (ii) gold which is not within conglomerate and/or paleoplacer style mineralization or (iii) minerals other than gold. Artemis' Mt Oscar tenement is excluded from the Definitive Agreements.

The Definitive Agreements cover 38 tenements/ tenement applications that are $100 \%$ owned by Artemis. Pursuant to Novo's successful earn-in, three 50:50 joint ventures have been formed between Novo's subsidiary, Karratha Gold Pty Ltd ("Karratha Gold") and three subsidiaries of Artemis (KML No 2 Pty Ltd, Fox Radio Hill Pty Ltd, and Armada Mining Pty Ltd). The joint ventures are managed as one
by Karratha Gold. Artemis and Novo will contribute to further exploration and any mining of the Gold Rights on a 50:50 basis. Further definitive agreements covering approximately 19 Artemis tenements/tenement applications that are already subject to third party interests are expected to be signed once all necessary third-party consents have been obtained

## FORWARD LOOKING STATEMENTS AND IMPORTANT NOTICE:

This report contains forecasts, projections and forward-looking information. Although the Company believes that its expectations, estimates and forecast outcomes are based on reasonable assumptions it can give no assurance that these will be achieved. Expectations, estimates and projections and information provided by the Company are not a guarantee of future performance and involve unknown risks and uncertainties, many of which are out of Artemis' control. Actual results and developments will almost certainly differ materially from those expressed or implied. Artemis has not audited or investigated the accuracy or completeness of the information, statements and opinions contained in this presentation. To the maximum extent permitted by applicable laws, Artemis makes no representation and can give no assurance, guarantee or warranty, express or implied, as to, and takes no responsibility and assumes no liability for (1) the authenticity, validity, accuracy, suitability or completeness of, or any errors in or omission from, any information, statement or opinion contained in this report and (2) without prejudice to the generality of the foregoing, the achievement or accuracy of any forecasts, projections or other forward looking information contained or referred to in this report.

Investors should make and rely upon their own enquiries before deciding to acquire or deal in the Company's securities.

## JORC Code, 2012 Edition - Table 1

## Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Sampling techniques | - Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. <br> - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. <br> - Aspects of the determination of mineralisation that are Material to the Public Report. <br> - In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. | - All resource drilling was RC drilling performed by Three Rivers Drilling during April and October 2017. <br> - The resource drilling comprised of 52 RC holes totaling $5,248 \mathrm{~m}$ of drilling. No previous drilling work was used in the resource estimation. <br> - Samples from each metre were collected through a rig-mounted cyclone and split using a rig-mounted static cone splitter and submitted to an independent laboratory for chemical analysis. <br> - Drilling included comprehensive QA/QC protocols including the use of certified standards, blanks and duplicate samples. <br> - To assist the site geologist, all samples were analysed using a portable XRF instrument (Niton \& Innovex) at drill site. <br> - Substantial historic drilling has been completed in the vicinity of the drilling completed by Artemis. The most significant work was completed by Consolidated Gold Mining Areas (1969), Open Pit Mining Limited (Open Pit) between 1985 and 1987, and Legend Mining NL (Legend) between 1995 and 2008. Compilation of this data has been completed based on Annual Exploration Reports available through WAMEX. Although limited information is available regarding procedures implemented during this period, work completed by Artemis to date has validated much of this historic data. It is considered that the historic work was completed professionally, and that certain assumptions can reasonably be based on results reported throughout this period. |
| Drilling techniques | - Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). | - Reverse Circulation drilling at Carlow Castle South was completed by a truck-mounted Schramm 685 RC drilling rig using a $51 / 4$ inch diameter face sampling hammer. |
| Drill sample recovery | - Method of recording and assessing core and chip sample recoveries | - Sample recoveries were recorded by the field geologist in the field during logging and sampling. |

| Criteria | JORC Code explanation |
| :--- | :--- |
|  | and results assessed. |
|  | Measures taken to maximise sample |
|  | recovery and ensure representative |
|  | nature of the samples. |
|  | Whether a relationship exists |
|  | between sample recovery and grade |
| and whether sample bias may have |  |
|  | occurred due to preferential |

| Logging | - Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Minera Resource estimation, mining studies and metallurgical studies. <br> - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. <br> - The total length and percentage of the relevant intersections logged. |
| :---: | :---: |

Sub-sampling techniques and sample preparation

- If core, whether cut or sawn and whether quarter, half or all core taken.
- If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.
- For all sample types, the nature, quality and appropriateness of the sample preparation technique.
- Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.
- Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.
- Whether sample sizes are appropriate to the grain size of the material being sampled.

## Commentary

- If poor sample recovery is encountered during drilling, the supervising geologist and driller endeavor to rectify the problem to ensure maximum sample representative nature of the recovery.
- Visual assessments by field geologist was made for moisture, and possible contamination, minor damp samples were encountered, field geologist and driller ensured cleanliness of cyclone and splitter was maintained
- A cyclone and static cone splitter were used to ensure representative sampling and were routinely inspected and cleaned.
- Sample recoveries during drilling completed by Artemis were high, and almost all samples were dry.
- There is no indication of a relationship between grade and sample recovery.
- All drill chip samples were geologically logged at 1 m intervals from surface to the bottom of each drillhole. It is considered that geological logging is completed at an adequate level to allow appropriate future Mineral Resource estimation.
- Geological logging is considered semi-quantitative due to the limited geological information available from the Reverse Circulation method of drilling.
- All RC drillholes completed by Artemis during the current program have been logged in full.
- The RC drilling rig was equipped with a rig-mounted cyclone and three-tier riffle splitter, which provided one bulk sample of approximately 20-30 kilograms, and a representative subsample of approximately 24 kilograms for every metre drilled.
- The sample size of 2-4 kilograms is considered to be appropriate and representative of the grain size and mineralisation style of the deposit, duplicate samples were collected and submitted for analysis confirming subsample representation
- The majority of samples were dry. Where wet sample was encountered, the cleanliness of the cyclone and splitter were closely monitored by the supervising geologist, and maintained to a satisfactory level to avoid contamination and ensure representative samples were being collected.
- Duplicate samples were collected and submitted for analysis. Reference standards inserted during drilling.

Quality of assay data and

- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered
- ALS (Perth) were used for all analysis of drill samples submitted by Artemis. The laboratory techniques below are for all samples submitted to ALS and
Criteria JORC Code explanation Commentary

| checks) and whether acceptable |  |
|  | levels of accuracy (ie lack of bias) |
| and precision have been |  |
| established. |  |

are considered appropriate for the style of mineralisation defined within the Carlow Castle Project area:

- Samples above 3Kg riffle split.
- Pulverise to $95 \%$ passing 75 microns
- 50 gram Fire Assay (AuAA26) with ICP finish - Au.
- 4 acid Digest ICP-AES Finish (ME-ICP61) $\mathrm{Ag}, \mathrm{Al}, \mathrm{As}, \mathrm{Ba}, \mathrm{Be}, \mathrm{Bi}, \mathrm{Ca}, \mathrm{Cd}, \mathrm{Co}$ ,Cr,Cu,Fe, $\mathrm{Ga}, \mathrm{K}$, $\mathrm{La}, \mathrm{Mg}, \mathrm{Mn}, \mathrm{Mo}, \mathrm{Na}, \mathrm{Ni}, \mathrm{P}, \mathrm{Pb}, \mathrm{S}$, $\mathrm{Sb}, \mathrm{Sc}, \mathrm{Sr}, \mathrm{Th}, \mathrm{Ti}, \mathrm{Tl}, \mathrm{U}, \mathrm{V}, \mathrm{W}, \mathrm{Zn}$
- Ore Grade 4 Acid Digest ICP-AES Finish (MEOG62)
- Standards were used for laboratory checks by Artemis.
- Duplicates were used for laboratory checks by Artemis.
- Portable XRF (pXRF) analysis was completed using both Niton \& Innovex units. XRF analysis was completed on the single metre sample bulk drill ample retained on site.
- Portable XRF results were only used as a guide to mineralised zones for sampling.
- At least two company personnel verify all significant results.
- No twin holes were drilled.
- All geological logging and sampling information is completed firstly on to paper logs before being transferred to Microsoft Excel spreadsheets.
Physical logs and sampling data are returned to the Hastings head office for scanning and storage.
- No adjustments of assay data are considered necessary.
- A Garmin GPSMap62 hand-held GPS was used to define the location of the drillhole collars. Standard practice is for the GPS to be left at the site of the collar for a period of 5 minutes to obtain a steady reading. Collar locations are considered to be accurate to within 5 m . The collars of all the completed holes were subsequently picked up with DGPS with an accuracy of within 1 cm and these coordinates were used for the resource modelling
- Downhole surveys were captured at 30 metre intervals for the drillholes.
- The grid system used for all Artemis drilling is GDA94 (MGA 94 Zone 50)
- Topographic control is obtained from surface profiles created by drillhole collar data.

Data spacing and
distribution

- Data spacing for reporting of Exploration Results.
- Whether the data spacing and distribution is sufficient to establish the degree of geological and grade
- Current drillhole spacing is variable and dependent on specific geological, and geophysical targets, and access requirements for each drillhole.
- No sample compositing has been

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  | continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. <br> - Whether sample compositing has been applied. | used for drilling completed by Artemis. All results reported are the result of 1 metre downhole sample intervals. <br> - AM\&AA believe that the spacing of the drilling along the shears at Carlow Castle South is sufficient for an Inferred resource estimate. |
| Orientation of data in relation to geological structure | - Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. <br> - If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. | - The drill holes were located in order to intersect the target at an angle perpendicular to strike direction. As the target structures were considered to be steep to moderately dipping, all Artemis drillholes were angled at -55 or -60 degrees. <br> - The intersection angle of the drilling with respect to the mineralisation was variable, making most drill intersections longer than the true width of the mineralisation. The resource modelling software uses the data in 3D and so compensates for the wider apparent thicknesses. |
| Sample security | - The measures taken to ensure sample security. | - The chain of custody is managed by the supervising geologist who places calico sample bags in polyweave sacks. Up to 10 calico sample bags are placed in each sack. Each sack is clearly labelled with: <br> - Artemis Resources Ltd <br> - Address of laboratory <br> - Sample range <br> - Samples were delivered by Artemis personnel to the transport company in Karratha and shrink wrapped onto pallets. <br> - The transport company then delivers the samples directly to the laboratory. |
| Audits or reviews | - The results of any audits or reviews of sampling techniques and data. | - Data is validated upon up-loading into the master database. Any validation issues identified are investigated prior to reporting of results. |

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Mineral tenement and land tenure status | - Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. <br> - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. | - The resource lies entirely within 47/1797-1 and is due to expire on 6/5/2018 after being extended from 6/5/2013. Artemis Resources Ltd, through its wholly owned subsidiary KML No. 2 Pty Ltd, purchased the tenement from Legend Mining Ltd on the 12th June 2012. <br> - This tenement forms a part of a broader tenement package that comprises the West Pilbara Project. <br> - This tenement is in good standing and no known impediments exist (see map provided in this report for location). |
| Exploration done by other parties | - Acknowledgment and appraisal of exploration by other parties. | - The most significant work to have been completed historically in the Carlow Castle area, including the Little Fortune and Good Luck prospects, was completed by Open Pit Mining Limited between 1985 and 1987, and subsequently Legend Mining NL between 1995 and 2008. <br> - Work completed by Open Pit consisted of geological mapping, geophysical surveying (IP), and RC drilling and sampling. <br> - Work completed by Legend Mining Ltd consisted of geological mapping and further RC drilling. <br> - Legend also completed an airborne ATEM survey over the project area, with follow up ground-based FLTEM surveying. Re-processing of this data was completed by Artemis, and was critical in developing drill targets for the completed RC drilling. <br> - Compilation and assessment of historic drilling and mapping data completed by both Open Pit and Legend has indicated that this data is compares well with data collected to date by Artemis. Validation and compilation of historic data is ongoing. <br> - All exploration and analysis techniques conducted by both Open Pit and Legend are considered to have been appropriate for the style of deposit. <br> - No drilling information from this previous work was used in the current resource modelling and estimation. |
| Geology | - Deposit type, geological setting and style of mineralisation. | - The Carlow Castle Co-Cu-Au prospect includes a number of mineralised shear zones, located on the northern margin of the Andover Intrusive Complex. Mineralisation is exposed in numerous workings at surface along numerous quartz rich shear zones. Both oxide and sulphide mineralisation is evident at surface |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  |  | associated with these shear zones. <br> - Sulphide mineralisation consists of chalcopyrite, chalcocite, cobaltite and pyrite |
| Drill hole Information | - A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <br> - easting and northing of the drill hole collar <br> - elevation or RL (Reduced Level elevation above sea level in metres) of the drill hole collar <br> - dip and azimuth of the hole <br> - down hole length and interception depth <br> - hole length. <br> - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. | - Collar information for all drillholes reported is provided in the body of this report. |
| Data aggregation methods | - In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. <br> - Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. <br> - The assumptions used for any reporting of metal equivalent values should be clearly stated. | - All intervals reported are composed of 1 metre down hole intervals, and are therefore length weighted. <br> - No upper or lower cut off grades have been used in reporting results. <br> - No metal equivalent calculations are used in this report. |
| Relationship between mineralisation widths and intercept lengths | - These relationships are particularly important in the reporting of Exploration Results. <br> - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. <br> - If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). | - True widths of mineralisation have not been calculated for this report, and as such all intersections reported are down-hole thicknesses. <br> - Due to the moderately to steeply dipping nature of the mineralised zones, it is expected that true thicknesses will be less than the reported down-hole thicknesses. <br> - The resource modelling was carried out in 3D and all apparent widths accounted for in the estimation method. |
| Diagrams | - Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole | - Appropriate maps and sections are available in the body of this announcement. |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  | collar locations and appropriate sectional views. |  |
| Balanced reporting | - Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. | - Reporting of results in this report is considered balanced. |
| Other substantive exploration data | - Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | - No other exploration data other than local geology maps were considered in the resource estimate. |
| Further work | - The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). <br> - Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. | - The results at the Carlow Castle CoCu -Au project warrant further drilling. As this is a first phase drill program the results to date are considered excellent. |

## Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Database integrity | - Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. <br> - Data validation procedures used. | - Data used as received was checked for Hole ID and sample interval errors by MineMap © software. Some RC sample assays in database were checked against laboratory spread sheets and no errors were found. |
| Site visits | - Comment on any site visits undertaken by the Competent Person and the outcome of those visits. <br> - If no site visits have been undertaken indicate why this is the case. | - Al Maynard from AM\&A has visited the site to verify the general site layout, available outcropping geology and drill hole collar locations using a hand-held GPS. |
| Geological interpretation | - Confidence in (or conversely, the uncertainty of ) the geological interpretation of the mineral deposit. <br> - Nature of the data used and of any assumptions made. <br> - The effect, if any, of alternative interpretations on Mineral Resource estimation. <br> - The use of geology in guiding and controlling Mineral Resource estimation. <br> - The factors affecting continuity both of grade and geology. | - The mineralisation is controlled by shears dipping steeply to the north. The mineralisation cannot be mapped at the surface due to soil cover however can be confidently interpreted from drilling data. Some supergene effects may have remobilised and possibly enriched some of the mineralisation in the upper oxidised zone. |
| Dimensions | - The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource. | - The modelled mineralisation strikes approximately $1,000 \mathrm{~m}$ east-west (including a 500 m gap as yet un-drilled between the main Carlow Castle South lode and the Eastern lode) and with multiple lodes spanning a zone up to 35 m north-south. The mineralisation is not properly closed off along strike or down dip. |
| Estimation and modelling techniques | - The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used. <br> - The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data. <br> - The assumptions made regarding | - The resource modelling was carried out with MineMap © software by interpolating grades into a digital block model using an Inverse Distance Cubed (ID3) algorithm confined by wire framing of the $>0.5 \mathrm{Au} \mathrm{ppm}+\mathrm{Cu} \%$ $+10 * \mathrm{Co} \%$ mineralised zones with 50 m search radii along and across strike and 100 m up and down dip only within the wireframes. <br> - Various high grade cuts were applied on basis of cutting to the mean plus two standard deviations method. <br> - $\mathrm{AM} \& \mathrm{~A}$ considers that these modelling parameters are appropriate for the resource of the type and style of mineralisation being modelled. |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  | recovery of by-products. <br> - Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation). <br> - In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed. <br> - Any assumptions behind modelling of selective mining units. <br> - Any assumptions about correlation between variables. <br> - Description of how the geological interpretation was used to control the resource estimates. <br> - Discussion of basis for using or not using grade cutting or capping. <br> - The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. |  |
| Moisture | - Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. | - All tonnes and grades are on a dry basis. |
| Cut-off parameters | - The basis of the adopted cut-off grade(s) or quality parameters applied. | - The resource modelling was confined by wire framing of the >0.5 Au ppm + $\mathrm{Cu} \%+10 * \mathrm{Co} \%$ mineralised zones. |
| Mining factors or assumptions | - Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made. | - No mining factors were considered for the resource estimate. <br> - Due to the shallow nature of the mineralisation, it is currently envisaged that open pit mining methods will be used, and geotechnical diamond drilling is being planned. |
| Metallurgical factors or assumptions | - The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. | - Only basic gravity and floatation/cyanidation testing was done on representative samples collected from the mineralised zone. This testing indicated that gravity and cyanidation is amenable to recovering most of the contained gold. |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  | Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made. |  |
| Environmenta I factors or assumptions | - Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. | - No environmental factors were considered however the tenement has sufficient suitable area to accommodate a small mining and processing operation including provision for waste disposal. <br> - There are no obvious especially environmentally sensitive areas in the vicinity of the deposit although the usual impact studies and government environmental laws and regulations will need to be complied with. |
| Bulk density | - Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples. <br> - The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit. <br> - Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. | - A bulk density of 2.5 was used in the assumed oxide zone and 3.0 in the primary zone. These values are based on down hole readings of a density probe and typical, if slightly conservative, for the rock types found at Carlow Castle South. |
| Classification | - The basis for the classification of the Mineral Resources into varying confidence categories. <br> - Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data). <br> - Whether the result appropriately reflects the Competent Person's view of the deposit. | - Considering the spacing of the drill intersections, quality of the drilling and sampling and the degree of understanding of the geological controls on the mineralisation, AM\&A have classified the reported resources at Carlow Castle South as Inferred according to the JORC Code (2012). <br> - AM\&A believes that this classification to be appropriate. |
| Audits or reviews | - The results of any audits or reviews of Mineral Resource estimates. | - No audits or reviews of the Mineral Resource Estimates have been made. |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Discussion of relative accuracy/ confidence | - Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. <br> - The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. <br> - These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. | - AM\&A have classified the reported resources at Carlow Castle South as Inferred according to the JORC Code (2012). <br> - This resource classification appropriately consider the relative accuracy of the estimates. The Inferred resource estimate relies on drill hole sampling and other geological data of sufficient quality, amount and its distribution to imply but not verify an interpretation of the geological framework and continuity of mineralisation. <br> - The quality of the data is considered to be reasonable for a resource estimate with adequate reporting of the QA/QC. <br> - All quoted estimates are global for the deposit. <br> - No mine production has been recorded at the deposit. |
