## Base, Battery and Precious Metals

ARTEMIS RESOURCES LIMITED IS AN AUSTRALIAN MINERAL DEVELOPER ADVANCING ITS WEST PILBARA BASE METALS, BATTERY AND PRECIOUS METALS ASSETS TOWARDS PRODUCTION.

ARTEMIS HAS CONSOLIDATED A MAJOR LAND HOLDING IN THE WEST PILBARA AND IS THE 100% OWNER OF THE RADIO HILL OPERATIONS AND PROCESSING INFRASTRUCTURE, STRATEGICALLY LOCATED 30 KM FROM THE CITY OF KARRATHA, THE POWERHOUSE OF THE PILBARA.

## UPDATE ON SUPER-DEEP DRILLING IN WEST PILBARA

- Western Australia -

Artemis Resources Limited (“Artemis” or “the Company”) (ASX: ARV) is pleased to provide this update on ASD-1, the West Pilbara super-deep diamond drill hole.

Diamond Drill Hole – ASD-1 Super Deep Hole	
Date	23 July 2018
Time	6 pm WST
Drill Size (outside diameter)	PQ (~122.6mm) (0-500m)
Drill Size (outside diameter)	HQ (~96mm) (500m – 1348.5)
End of Hole	1,348.5 metres

## HIGHLIGHTS

- ASD-1 has been drilled to a depth of 1,348.5 metres.
- The diorite-granodiorite was entered at a depth 644.4 metres continued to the end of hole. This change in geology from Hardey Formation at such a shallow depth was unexpected.
- Alteration minerals, bleaching and a number of quartz and pegmatitic veins have been observed. Logging of the core continues. Further analysis of the Felsic Intrusive (diorite-granodiorite) will be ongoing with work by GSWA and CSIRO.
- The interpreted basin continuously deepening to the south of the Munni Munni gabbro has been found to be incorrect (Figure 1). It is possible that the Fortescue Basin topography (when sediments were emplaced) is undulating and therefore is fertile for sites and areas where mafic gold rich conglomerates can form.
- As such a second drill hole (ASD-2) will shortly commence to further understand the geology and the nature of the contacts between sedimentary rocks and felsic intrusions or basement geology.
- ASD-2 is located 3.6 km to the west of ASD-1 (Figure 3) and will be drilled by DDH-1 Drilling Pty Ltd.

## OVERVIEW

ASD-1 was planned for a vertical depth of +3,300m and designed to test the many rock sequences in the Pilbara Basin from surface and deep into the basement's geology. These deeper rock sequences were interpreted or inferred to exist, based on very sparse data. This surface and shallow data does not explain observed surface mineralisation of diamonds, cobalt, zinc, lead and gold.

What Artemis has defined at this early stage is valuable as it shows the basement (hard rock geology) is undulating and at this location dips to the north from ASD-1. The sediments (now rock) have filled in the topography that existed, which would have been hills and valleys. This means there are fertile sites and areas where mafic gold rich conglomerates can form, like between ASD-1 and Munni Munni (**Figure 1**).

A new drill hole (ASD-02), to be drilled by DDH-1 Pty Ltd with their larger 5000 diamond core drill rig, will commence shortly. A drill site 3.6 km to the west of ASD-1 has been selected which will initially test to see if the diorite-granodiorite exists in this location and if not, drill to basement.

Artemis continues to review work at Munni Munni with a view to using diamond drill holes to look for additional shallow mafic gold rich conglomerates.

**Figure 1: Schematic Interpretative Long-Section. North-South orientation of section with Munni Munni and Purdy's Reward to the north (right side of image)**

## Previous Exploration

The primary target for all previous drilling was the Munni Munni Igneous Complex gabbro's that host the PGE reef mineralisation at Munni Munni. A substantial amount of the drill holes reviewed to date have little to no information on sediments above the Munni Munni Igneous Intrusion.

The drill database that Artemis has acquired while earning in to the Platina Resources Munni Munni Joint Venture is the source for drill holes MMD178, MMD223 and MMPD07 which have been used to generate and expand the Schematic Interpretative Long Section (**Figure 1**).

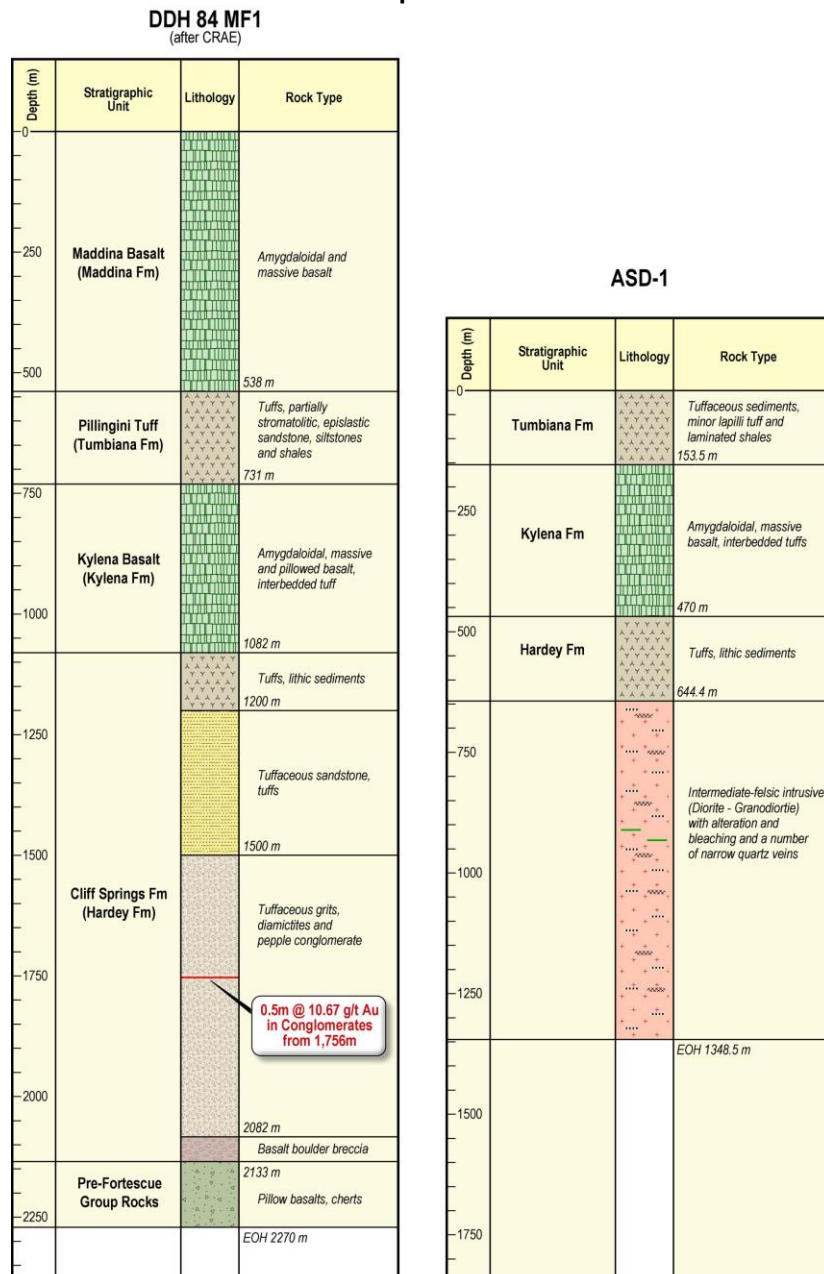

A comparison drill log with the CRA drill hole can be seen in **Figure 2**.

Further analysis of the Felsic Intrusive (Diorite-Granodiorite) is ongoing with the GSWA and CSIRO. This work will be looking at the exact type of felsic intrusive and how it relates to observed surface mineralisation observed to date.

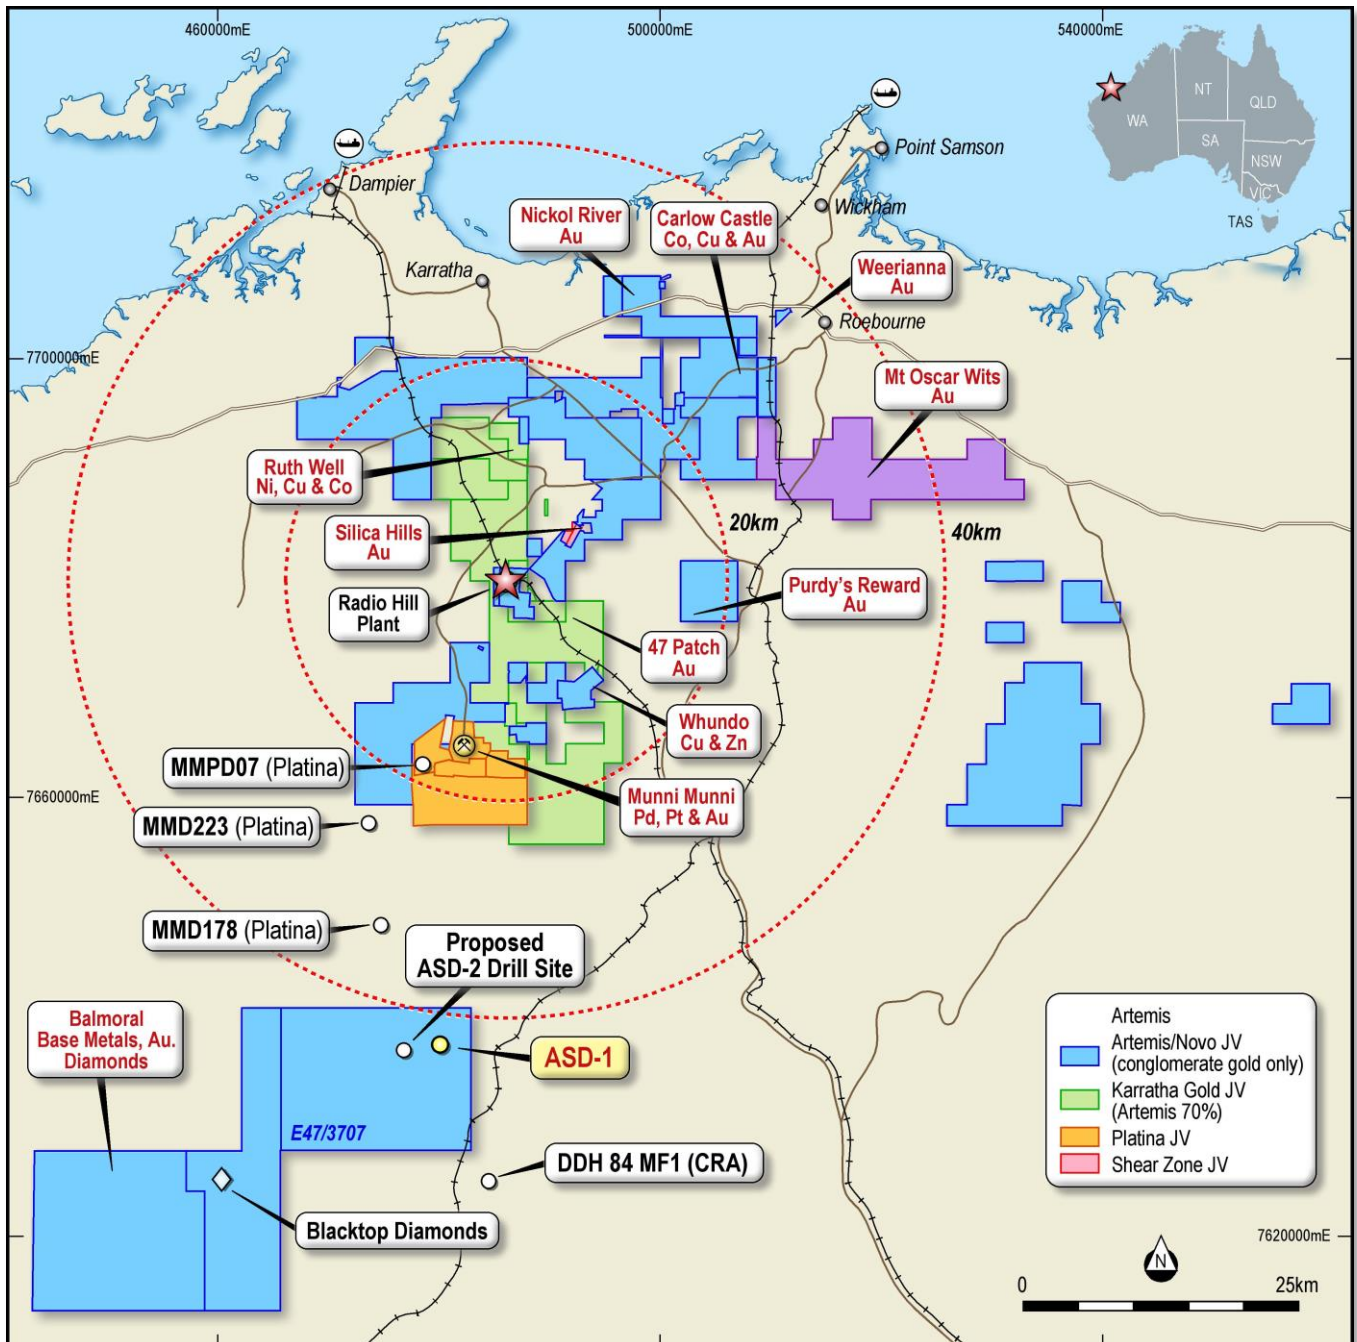

Drill core from ASD-1 is being moved from the drill site to Artemis's Radio Hill Operations, located some 43 km to the north, where core is being logged and photographed. The whole core will then be sent to the GSWA's Perth Core Library for analysis.

ASD-1 is located on E47/3707 (co-ordinates 480100mE, 7637370mN, 330m RL, Azi: 180, Dip: -85 degrees), some 43km south of Artemis' Radio Hill Mine in the West Pilbara, of Western Australia. (Refer to previous Artemis news release, dated 22 March 2018 for further details on ASD-1). **Figure 2** highlights the CRA diamond drill hole DDH 84 MF1 that was drilled in 1986, which now resides at the WA Core Library.

**Figure 2: Summary drill logs for CRAE drill hole and progress summary drill log for Artemis's ASD-1. Geology comparison.**

**COMPETENT PERSONS STATEMENT:**

The information in this document that relates to Exploration Results and Exploration Targets is based on information compiled or reviewed by Edward Mead, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Mead is a Director of Artemis Resources Limited and is a consultant to the Company, and is employed by Doraleda Pty Ltd. Mr Mead has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Mead consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

## Appendix 1: CRAE Collar Location & Significant Analyses from DDH84MF#1 drilled in 1984-85, reported in 1987.

Note: Latitude /Longitude converted to MGA Zone 50 co-ordinates by Artemis personnel.

Hole_ID	Hole Type	Max Depth	MGA_N	MGA_E	Latitude	Longitude	From (M)	To (M)	Au (ppm)	Au (ppm) (rpt)
DDH84MF#1	DDH	2270	7627119	484459	-21° 27.5"	116° 51"	1756	1756.5	10.67	11.7

## Appendix 2: Platina Resources Collar Locations used in the Schematic Interpretative Long Section

Collar Coordinates in MGA_Zone 50				
Platina MMPD07	180	478314	7662894	615.7
Platina MMD223	180	473450	7657515	330.7
Platina MMD178	200	474510	7648250	714.84

## JORC Code, 2012 Edition – Table 1

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g</li> </ul>	<p><u>CRA drillhole</u></p> <ul style="list-style-type: none"> <li>Sampling was undertaken diamond core drilling</li> <li>Diamond drill core was cut in half with a diamond blade on nominal 0.5 metre interval, or to lithological contacts.</li> <li>Sampling was carried out using protocols established by CRA Exploration at the time.</li> </ul> <p><u>ASD-1</u></p> <ul style="list-style-type: none"> <li>No sampling undertaken</li> </ul> <p><u>Munni Munni (Platina) Project</u></p> <ul style="list-style-type: none"> <li>No sampling being reported.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<i>charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>• <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<p><u>CRA drillhole</u></p> <ul style="list-style-type: none"> <li>• Diamond drilling has been undertaken by Rockdrill Pty Ltd</li> <li>• Drilling was Reverse Circulation to 257.5m, HQ diamond drilling to 960.5m and NQ diamond drilling to 2269.95m.</li> </ul> <p><u>ASD-1</u></p> <ul style="list-style-type: none"> <li>• Diamond drilling from surface is being undertaken by DDH 1 Drilling Pty Ltd.</li> <li>• All core to date is PQ which is intended to be finished at 600m, when core size will change to HQ.</li> </ul> <p><u>Munni Munni (Platina) Project</u></p> <ul style="list-style-type: none"> <li>• A combination of drilling by Reverse Circulation and Diamond core.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>• <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> <li>• <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li>• <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<p><u>CRA drillhole</u></p> <ul style="list-style-type: none"> <li>• Diamond drilling recovery has generally been excellent and close to 100%.</li> <li>• The core is measured against core blocks placed at the end of each drill rod pull.</li> </ul> <p><u>ASD-1</u></p> <ul style="list-style-type: none"> <li>• Diamond drill recovery to date is excellent at 100%.</li> <li>• Core is measured and marked against core blocks.</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li>• <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li>• <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></li> </ul>	<p><u>CRA drillhole</u></p> <ul style="list-style-type: none"> <li>• Reverse Circulation drill chips were lithologically logged</li> <li>• Diamond core is lithologically logged.</li> </ul> <p><u>ASD-1</u></p> <ul style="list-style-type: none"> <li>• Diamond core is lithologically logged.</li> </ul> <p><u>Munni Munni (Platina) Project</u></p>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>A combination of drilling by Reverse Circulation and Diamond core was lithologically logged for Platinoids.</li> </ul>
<b>Sub-sampling technique: and sample preparation</b>	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<p><u>CRA drillhole</u> Diamond core is cut using the shimming technique where approx. a third was taken from the core.</p>  <p><u>ASD-1</u></p> <ul style="list-style-type: none"> <li>Diamond core has not been cut or sampled yet.</li> </ul>
