**BASE, BATTERY AND
PRECIOUS METALS**

ARTEMIS RESOURCES LIMITED IS AN AUSTRALIAN MINERAL DEVELOPER ADVANCING ITS WEST PILBARA BASE, BATTERY AND PRECIOUS METALS ASSETS TOWARDS PRODUCTION.

ARTEMIS HAS CONSOLIDATED A MAJOR LAND HOLDING IN THE WEST PILBARA AND IS THE 100% OWNER OF THE RADIO HILL OPERATIONS AND PROCESSING INFRASTRUCTURE, STRATEGICALLY LOCATED 30 KM FROM THE CITY OF KARRATHA, THE POWERHOUSE OF THE PILBARA.

**SIGNIFICANT UPGRADE TO COPPER AND ZINC RESOURCES
AT WHUNDO MINE**

**Indicated tonnage now 2.6Mt @ 1.14% Cu and 1.14% Zn for 30,266 t
contained Copper and 30,289 t contained Zinc**

Artemis Resources Limited (“Artemis” or “the Company”) (ASX:ARV, Frankfurt:ATY, US OTC:ARTTF) is pleased to announce a significant improvement in this latest JORC 2012 resource estimate for the company’s 100% owned Whundo Copper Mine in the West Pilbara region of Western Australia. The October 2018 resource estimate is classified to JORC 2012 compliant Indicated category.

Figure 1: Whundo Mine Deposits, 7km from Radio Hill Processing Plant.

Artemis’ Chief Executive Officer Wayne Bramwell commented:

“This resource upgrade has seen a circa 30% uplift in the Whundo sulphide resource to 2.2Mt and contained copper and zinc metal tonnes has grown significantly to ≈60,000t combined. The shallow oxide resource is entirely new.

Whundo was shut down in 2008 due to low copper and zinc prices. It is a valuable asset, considering it is an approved Mining Lease and is so close to our Radio Hill processing plant. The oxide grade of 1.75% Cu is tantalizing and with this zone extending from near surface to ≈40m below surface, Artemis is evaluating the integration of SX-EW processing at Radio Hill.

In addition, the larger sulfide zone could provide an additional blending source that could supplement Carlow Castle ore and further enhance copper grade to the Radio Hill Operations.”

WHUNDO COPPER PROJECT RESOURCE SUMMARY

The Whundo Copper Project is in the West Pilbara region of Western Australia, ~50 km by road south of Karratha (**Figure 2**). Access is along the Karratha / Tom Price sealed road, and then mine access tracks. Whundo is on a fully approved mining lease and is located only about 7km from Artemis' 100% owned Radio Hill Processing Plant. Whundo was the last ore to be processed through the Radio Hill sulphide plant when the mine and plant were placed in to care and maintenance in 2008 due to low copper prices.

Artemis recently completed RC drilling of the Whundo Copper deposit, aiming to verify older non-JORC compliant drilling and to increase the drill data available in the upper levels of the mineralisation. Previous drilling comprised 870 drill holes of percussion and diamond drilling for a total of approximately 52,586 metres. Artemis Resources have drilled another 64 Reverse Circulation ("RC") drill holes and 7 diamond drill holes for an additional 5,490 metres in 2018.

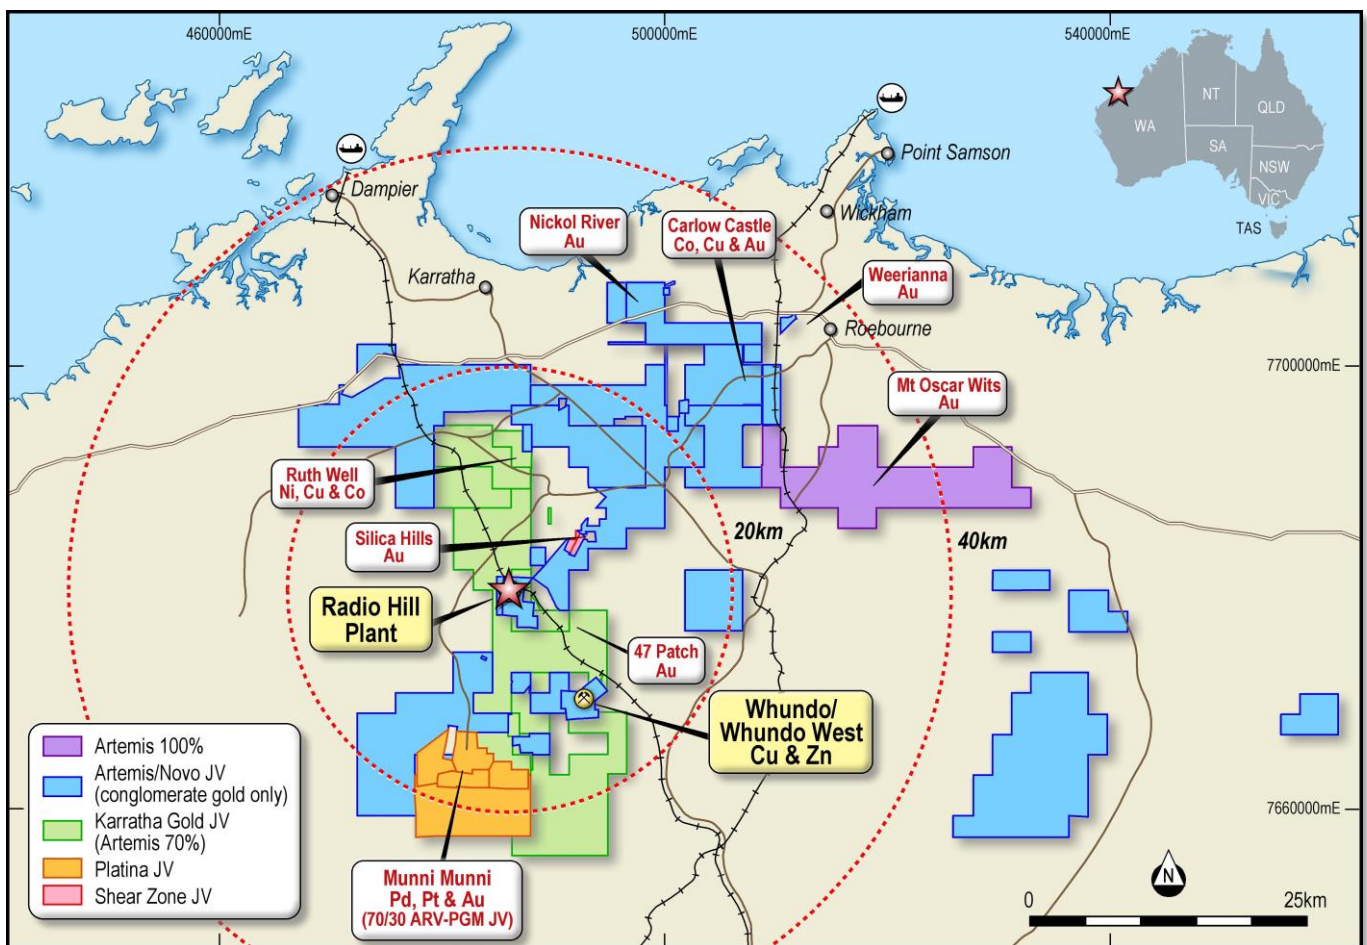

Figure 2: Whundo Copper Project Location Map.

The Whundo deposit occurs in two zones, Whundo and Whundo West, hosted within a single stratigraphic horizon as a series of NW-NNW plunging shoots, which may be traced on surface over 500m as discontinuous goethite-hematite gossans. The mineralised shoots typically vary from 1m to 5m thick but may thicken to 20m in fold hinge zones. The shoots plunge to the NW at 35-40° with a down plunge extent of up to 150m.

The Artemis drilling results have been merged with the older data. Al Maynard and Associates (AM&A) undertook resource modelling and estimation incorporating both data sets. Fox Resources partially mined both the oxide and fresh zones of the deposit during 2005 – 2008. Previously mined material is excluded from the resource estimate.

AM&A modelled the Whundo/West Whundo deposit, with Minemap software, utilising all available RC and diamond drilling. The grade interpolation method was inverse distance squared (ID2), constrained by mineralisation wireframes derived from drill hole assay intersections.

CLASSIFICATION

AM&A has classified the entire resource as an Indicated Resource, using a resource cut off of $Cu\% + Zn\% \times (Zn \text{ metal price}/Cu \text{ metal price}) \geq 0.5\%$. This is in effect a copper equivalent where a copper metal price of USD\$6,058/tonne and a zinc metal price of USD\$2,457/tonne was applied. The resource is tabulated by material type (**Table 1**).

The material type oxide is blocks above the transition surface base digital terrain model (DTM) and fresh material is below the transition surface base DTM.

**Table 1: 2012 JORC Estimate for the Whundo Cu-Zn Project
(October 2018 - Indicated Resources)**

Material Type	Tonnage (tonnes x	Copper Grade (Cu %)	Zinc Grade (Zn %)	Copper Metal (tonnes Cu)	Zinc Metal (tonnes Zn)
Oxide	390	1.75	0.47	6,810	1,839
Fresh	2,260	1.04	1.26	23,456	28,450
Total	2,649	1.14	1.14	30,266	30,289

The JORC Code, 2012, Table 1 Sections 1, 2 and 3 are appended at the end of this announcement.

The October 2018 resource shows an increase in both oxide and fresh material types as compared to the Fox Resources 2012 resources (refer 4 April 2012, – “Fox Resources Exploration Update”, Public announcement ASX - www.asx.com.au/asxpdf/20120404/pdf/425fyyslg7ldy1.pdf)

DRILLING INFORMING THE WHUNDO PROJECT RESOURCE ESTIMATE

Drilling data used to inform the resource estimate is summarised in **Table 2** , this only includes RC and diamond drill holes. The database includes drilling carried out by a number of previous operators stretching back to the 1960’s. Historical data has been sourced from an industry standard digital database (Fox Resources) and original hardcopy data. Recent drill data is derived from the Artemis database.

Table 2: Summary list of drill holes used in the resource estimate

The Artemis drilling had two purposes, one to infill less well drilled areas and the other to verify some of the older drilling to increase confidence in the original data that had been merged with the Artemis data. **Figure 3** below depicts the relationship between some of the Artemis drilling and some of the original drilling. It can be readily seen that the correlation between the two phases of drilling is satisfactory.

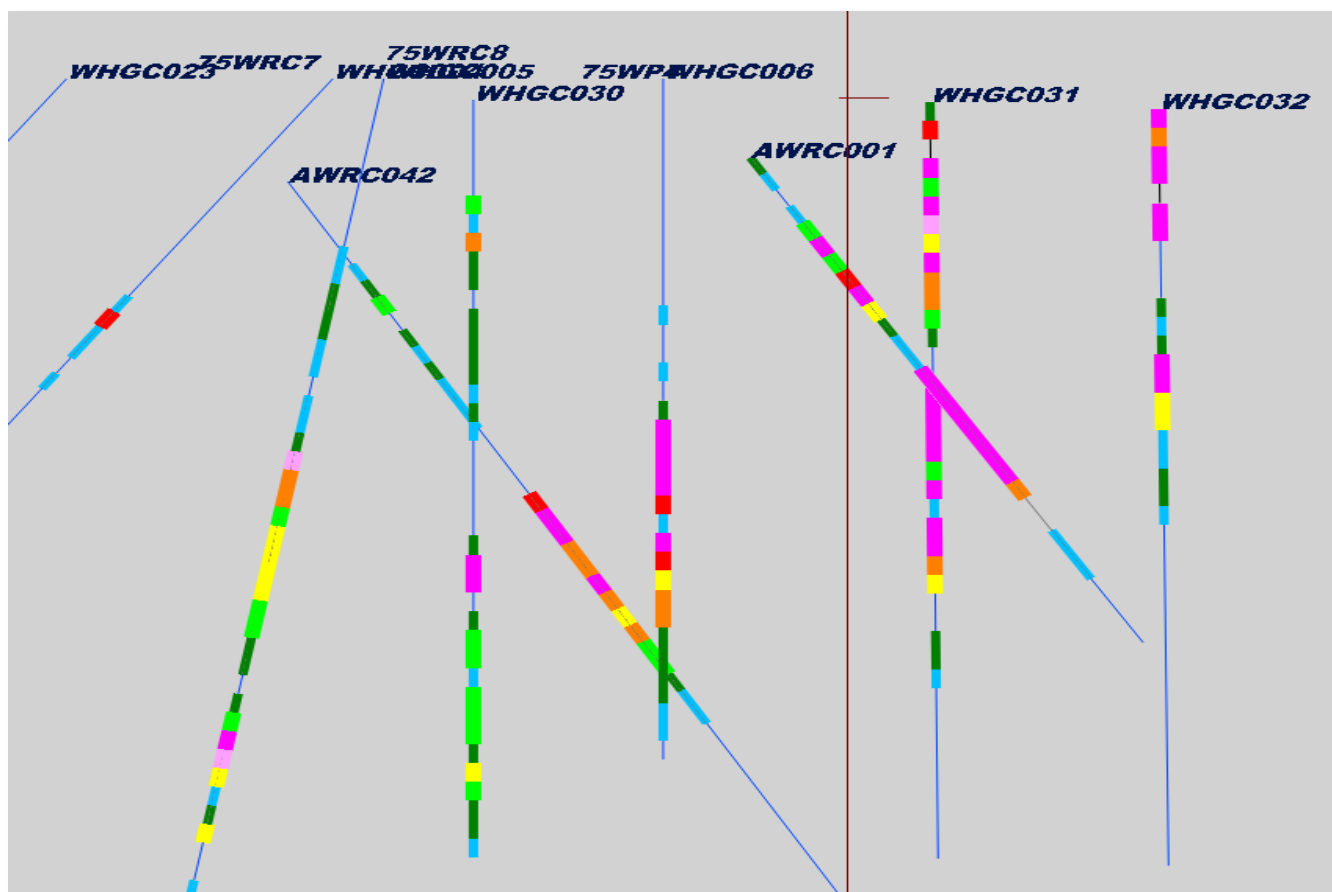

Figure 3: Artemis drilling (AWRC prefix) and prior original drilling colour coded for Cu% + 0.5 x Zn%

RESOURCE MODEL

The resource was modelled by wireframing the mineralisation to reflect the geometry of the individual shoots. The boundary was based on a combination of Cu and Zn assays where the boundary value metal %, was $\text{Cu\%} + \text{Zn\%} * (2457/6058) > 0.5$.

This method of boundary definition was selected due to the correlation between Cu and Zn and the potential for them to be recovered through a proposed flotation circuit at Radio Hill. Some internal dilution was included to facilitate improved continuity with other adjacent drill intersections. Internal dilution was not included if the result was to reduce the total intersection below 0.5%.

The Cu and Zn grades were estimated separately using ID2 with the search ellipse reflecting the interpreted geology.

Figure 4: below is a 3D perspective view of the total block model, including material types denoted as oxide and fresh. The interface between these material types, the transition surface base, is generally about 35m to 45m below natural surface.

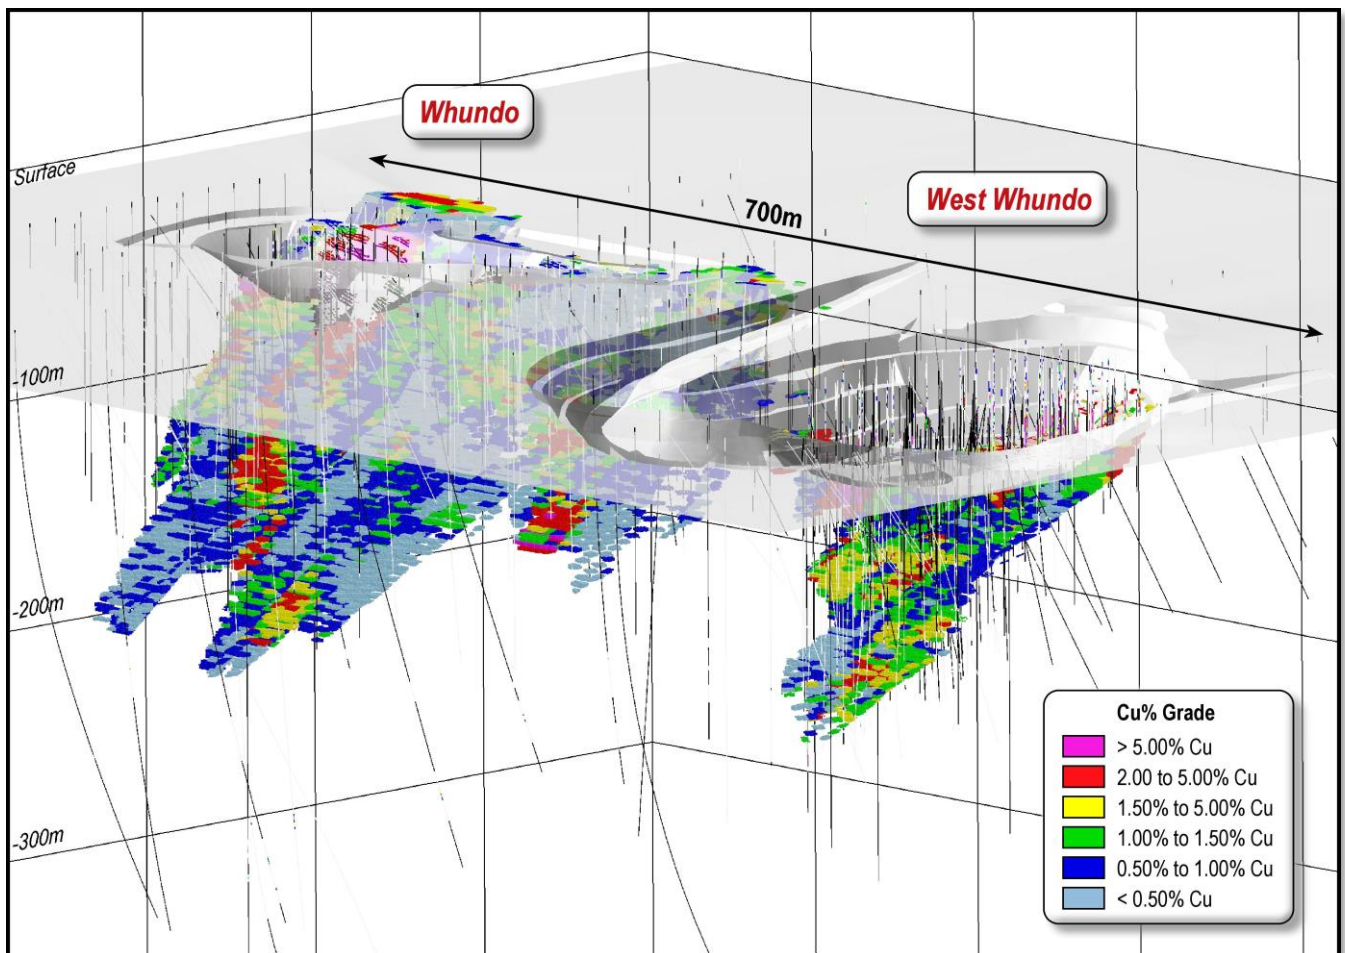

Figure 4: Whundo Project block model, colour coded for Cu% grade, with drill hole traces and the as mined pits/topography DTM

The cross section on 492500E (**Figure 5**) through the Whundo mineralisation shows the relationship between high grade remnant mineralisation in the Whundo pit wall and as yet unmined mineralisation to the west of slightly lower grade than once existed inside the pit. Blocks and drill holes are colour coded for Cu%.

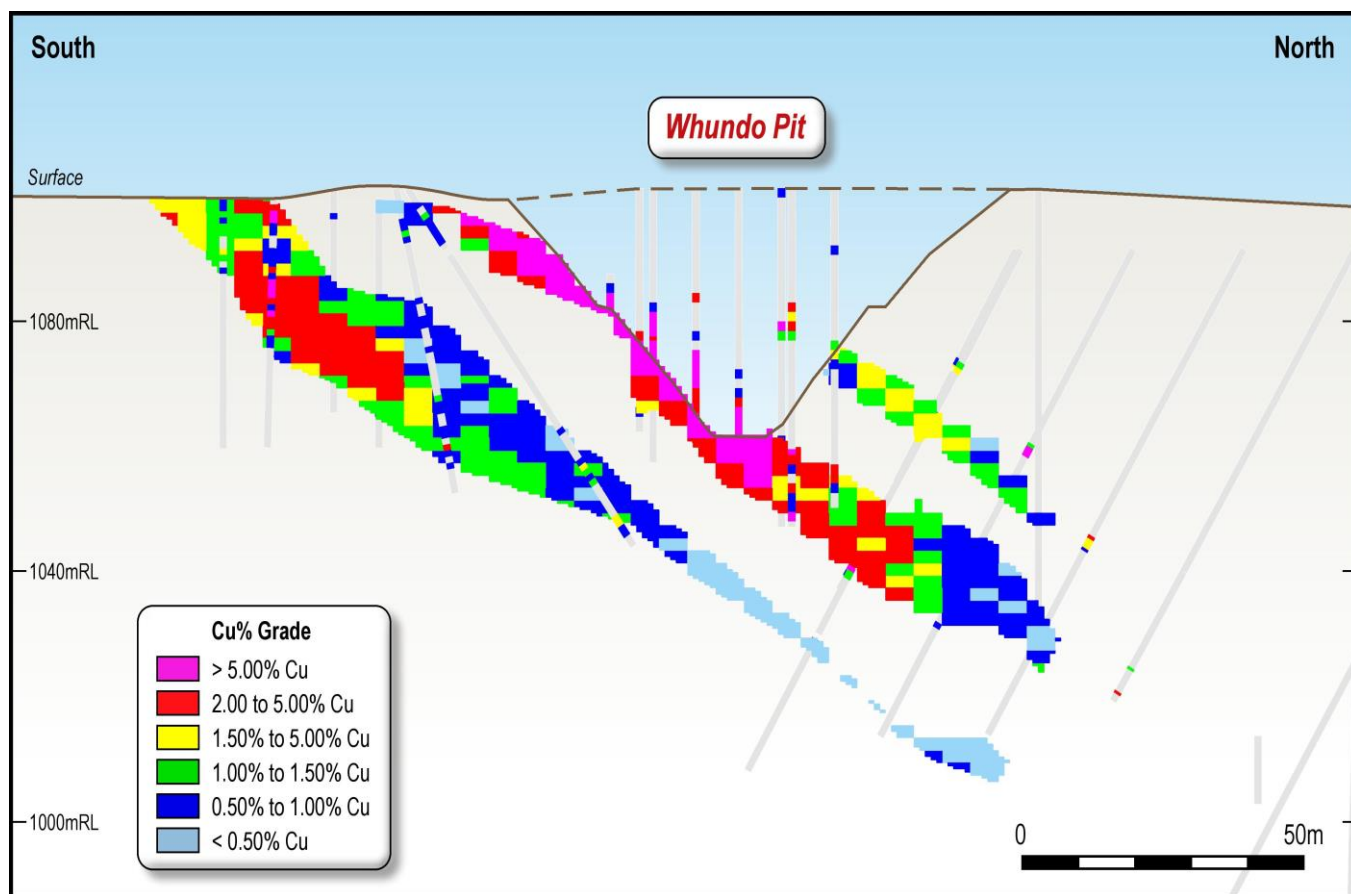

Figure 5: Whundo Cross section (492500E - looking west)

COMPETENT PERSONS STATEMENT

The information in this announcement that relates to the Whundo Project Resource is based on the Whundo Project Resource Report written by Mr Philip A Jones, who is a Member of the Australasian Institute of Mining and Metallurgy and a Member of the Australian Institute of Geoscientists. Mr Jones is a consultant working for Al Maynard & Associates (AM&A) who were engaged by Artemis Resources to prepare the report and undertake the resource estimation for the Whundo Project for the period ending 30 September 2018. Mr Jones has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'.

Mr Jones consents to the inclusion in the announcement of the matters based on his information in the form and context in which it appears.

BACKGROUND INFORMATION ON ARTEMIS RESOURCES

Artemis Resources Limited is an exploration and development company focussed on its large (~2,400 km²) and prospective base, battery and precious metals assets in the Pilbara region of Western Australia. Artemis owns 100% of the 500,000 tpa Radio Hill processing plant and infrastructure, located approximately 35 km south of the city of Karratha.

The Company is evaluating 2004 and 2012 JORC Code compliant resources of gold, nickel, copper-cobalt, PGE's and zinc, all situated within a 40 km radius of the Radio Hill plant.

Artemis have signed Definitive Agreements with Novo Resources Corp. ("Novo"), which is listed on Canada's TSX Venture Exchange (TSXV:NVO), and pursuant to the Definitive Agreements, Novo has satisfied its expenditure commitment, and earned 50% of gold (and other minerals necessarily mined with gold) in conglomerate and/or paleoplacer style mineralization in Artemis' tenements within 100 km of the City of Karratha, including at Purdy's Reward ("the Gold Rights"). The Gold Rights do not include:

- (i) gold disclosed in Artemis' existing (at 18 May 2017) JORC Code Compliant Resources and Reserves; or
- (ii) gold which is not within conglomerate and/or paleoplacer style mineralization; or
- (iii) minerals other than gold.

Artemis' Mt Oscar tenement is excluded from the Definitive Agreements. The Definitive Agreements cover 36 tenements / tenement applications that are 100% owned by Artemis.

Pursuant to Novo's successful earn-in, two 50:50 joint ventures have been formed between Novo's subsidiary, Karratha Gold Pty Ltd ("Karratha Gold") and two subsidiaries of Artemis (KML No 2 Pty Ltd and Fox Radio Hill Pty Ltd). The joint ventures are managed as one by Karratha Gold with Artemis and Novo contributing to further exploration and any mining of the Gold Rights on a 50:50 basis.

FORWARD LOOKING STATEMENTS AND IMPORTANT NOTICE

This report contains forecasts, projections and forward-looking information. Although the Company believes that its expectations, estimates and forecast outcomes are based on reasonable assumptions it can give no assurance that these will be achieved. Expectations, estimates and projections and information provided by the Company are not a guarantee of future performance and involve unknown risks and uncertainties, many of which are out of Artemis' control.

Actual results and developments will almost certainly differ materially from those expressed or implied. Artemis has not audited or investigated the accuracy or completeness of the information, statements and opinions contained in this announcement. To the maximum extent permitted by applicable laws, Artemis makes no representation and can give no assurance, guarantee or warranty, express or implied, as to, and takes no responsibility and assumes no liability for the authenticity, validity, accuracy, suitability or completeness of, or any errors in or omission from, any information, statement or opinion contained in this report and without prejudice, to the generality of the foregoing, the achievement or accuracy of any forecasts, projections or other forward looking information contained or referred to in this report.

Investors should make and rely upon their own enquiries before deciding to acquire or deal in the Company's securities.

JORC Code, 2012 Edition – Table 1 (extracted from AM&A report)

Section 1 Sampling Techniques and Data THIS SECTION REFERS TO THE ARTEMIS 2018 RC DRILLING PROGRAM ONLY

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i> 	<ul style="list-style-type: none"> Reverse Circulation (RC) drilling was carried out on the Whundo Project. This drilling was designed to obtain drill chip samples from one metre intervals, from which a 2-4 kilogram sub-sample was collected for laboratory multi-element analysis including: Ag,Al,As,Ba,Be,Bi,Ca,Cd,Co,Cr,Cu,Fe,Ga,K,La,Mg,Mn,Mo,Na,Ni,P,Pb,S,Sb,Sc,SrTh,Ti,Tl,U,V,W,Zn. All samples were analyzed using a portable XRF instrument (Innovex). Initial methodology trialing the units has been to make a single randomly placed measurement on the drill sample bag. Optimum sampling time appears to be 90 seconds per measurement. Mineralised zones were identified visually during field logging, and sample intervals selected by the supervising geologist. Samples from each metre were collected through a rig-mounted cyclone and split using a rig-mounted static cone splitter. Field duplicates were taken and submitted for analysis. Substantial historic drilling has been completed in the vicinity of the drilling completed by Artemis. The most significant work was completed by Whim Creek <p>Consolidated s in the early mid 1970’s and by Fox Resources 2004-2007. Compilation of this data has been completed based on Annual Exploration Reports available through WAMEX. Although limited information is available regarding procedures implemented during this period, work completed by Artemis to date has validated much of this historic data. It is considered that the historic work was completed professionally, and that certain assumptions can reasonably be based on results reported throughout this period.</p>
Drilling techniques	<ul style="list-style-type: none"> <i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> 	<ul style="list-style-type: none"> Reverse Circulation drilling at Whundo was completed by a truck-mounted Schramm 685 RC drilling rig using a 5¼ inch diameter face sampling hammer.
Drill sample recovery	<ul style="list-style-type: none"> <i>Method of recording and assessing core and chip</i> 	<ul style="list-style-type: none"> Sample recoveries are recorded by the geologist in the field during logging and sampling.

Criteria	JORC Code explanation	Commentary
	<p><i>sample recoveries and results assessed.</i></p> <ul style="list-style-type: none"> Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> If poor sample recovery is encountered during drilling, the supervising geologist and driller endeavor to rectify the problem to ensure maximum sample recovery. Visual assessments are made for recovery, moisture, and possible contamination. A cyclone and static cone splitter were used to ensure representative sampling and were routinely inspected and cleaned. Sample recoveries during drilling completed by Artemis were high, and all samples were dry. Insufficient data exists at present to determine whether a relationship exists between grade and recovery. This will be assessed once a statistically representative amount of data is available.
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> All drill chip samples are geologically logged at 1m intervals from surface to the bottom of each drill hole. It is considered that geological logging is completed at an adequate level to allow appropriate future Mineral Resource estimation. Geological logging is considered semi-quantitative due to the limited geological information available from the Reverse Circulation method of drilling. All RC drill holes completed by Artemis during the current program have been logged in full. All diamond core is lithologically logged and sample intervals defined by mineralisation.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being 	<ul style="list-style-type: none"> The RC drilling rig was equipped with a rig-mounted cyclone and static cone splitter, which provided one bulk sample of approximately 20-30 kilograms, and a representative sub-sample of approximately 2-4 kilograms for every metre drilled. The sample size of 2-4 kilograms is appropriate and representative of the grain size and mineralisation style of the deposit. The majority of samples were dry. Where wet sample was encountered, the cleanliness of the cyclone and splitter were closely monitored by the supervising geologist and maintained to a satisfactory level to avoid contamination and ensure representative samples were being collected. Diamond core is cut in half with an Almondite automated core cutting machine using cradles. Duplicate samples were collected and submitted for analysis. Reference standards inserted during drilling.

Criteria	JORC Code explanation	Commentary
	<i>sampled.</i>	
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i> 	<ul style="list-style-type: none"> ALS (Perth) were used for all analysis of drill samples submitted by Artemis. The laboratory techniques below are for all samples submitted to ALS and are considered appropriate for the style of mineralisation defined within the Whundo Project area: <ul style="list-style-type: none"> Samples above 3Kg riffle split. Pulverise to 95% passing 75 microns 50-gram Fire Assay (Au-AA26) with ICP finish - Au. 4 Acid Digest ICP-AES Finish (ME-ICP61) – Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Ga, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W, Zn. Ore Grade 4 Acid Digest ICP-AES Finish (ME-OG62) Standards were used for external laboratory checks by Artemis. Duplicates were used for external laboratory checks by Artemis. Portable XRF (pXRF) analysis was completed using Innovex Delta unit. XRF analysis was completed on the single metre sample bulk drill ample retained on site. Further statistical analysis will be completed to better determine the accuracy and precision of the pXRF unit based on laboratory assay results. Portable XRF results are considered semi-quantitative and act as a guide to mineralised zones and sampling.
Verification of sampling and assaying	<ul style="list-style-type: none"> <i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> At least two company personnel verify all significant results. All geological logging and sampling information is completed firstly on to paper logs before being transferred to Microsoft Excel spreadsheets. Physical logs and sampling data are returned to the Hastings head office for scanning and storage. No adjustments of assay data are considered necessary.
Location of data points	<ul style="list-style-type: none"> <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i> 	<ul style="list-style-type: none"> A Garmin GPSMap62 hand-held GPS was used to define the location of the drill hole collars. Standard practice is for the GPS to be left at the site of the collar for a period of 5 minutes to obtain a steady reading. Collar locations are accurate to within 5m. Collars are surveyed with a DGPS. Downhole surveys were captured at 30 metre intervals for the drill holes completed by Artemis. The grid system used for all Artemis drilling is GDA94 (MGA 94 Zone 50) Topographic control is obtained from surface profiles created by drill hole collar data.
Data spacing and distribution	<ul style="list-style-type: none"> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore</i> 	<ul style="list-style-type: none"> Current drill hole spacing is variable and dependent on specific geological, and geophysical targets, and access requirements for each drill hole. No sample compositing has been used for drilling completed by Artemis. All results reported are the result of 1 metre downhole sample intervals.

Criteria	JORC Code explanation	Commentary
	<i>Reserve estimation procedure(s) and classifications applied.</i> <ul style="list-style-type: none"> Whether sample compositing has been applied. 	
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Drill holes were located in order to intersect the target at an angle perpendicular to strike direction. As the target structures were steep to moderately dipping, all Artemis drill holes were angled at - 60 degrees.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> The chain of custody is managed by the supervising geologist who places calico sample bags in polyweave sacks. Up to 5 calico sample bags are placed in each sack. Sacks from individual holes were placed into bulk bags, each bulk bag is labelled with: <ul style="list-style-type: none"> Artemis Resources Ltd Address of laboratory Sample range Samples were delivered by Artemis personnel to the transport company in Karratha on pallets. The transport company then delivers the samples directly to the laboratory.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> Data is validated upon up-loading into the master database. Any validation issues identified are investigated prior to reporting of results.

Section 2 Reporting of Exploration Results, **THIS SECTION REFERS TO THE ARTEMIS 2018 RC DRILLING PROGRAM ONLY**

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. 	<ul style="list-style-type: none"> RC drilling by Artemis was carried out on M47/007 – 100% owned by Artemis Resources Ltd. This tenement forms a part of a broader tenement package that comprises the West Pilbara Project. This tenement is in good standing and no known impediments exist (see map provided in this report for location).

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	
Exploration done by other parties	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<ul style="list-style-type: none"> The most significant work to have been completed historically in the Whundo area, was by Westfield Minerals NL, later Whim Creek Consolidated NL. Work completed by Westfield/Whim Creek consisted of geological mapping, geophysical surveying, geochemical sampling and diamond and RAB drilling and sampling. This outlined several high-grade shoots including the one mined in the Whundo pit in 1976. An estimated 6,746t of 27.4% Cu ore was produced. Whim Creek continued involvement with the project area after becoming Dominion Metals until 1995 when the tenements were sold to Straits Resources Ltd. Dominion had completed drilling and resource estimation on Whundo and pit plans were completed but not implemented. Straits completed drilling along strike to expand resources and did not identify additional oxide resources to warrant development and shipping to Whim Creek. Fox Resources Ltd obtained control of the tenements from Straits in 2003 and subsequently undertook an extensive drilling program on the West Whundo deposit outlining a combined Oxide/Supergene/Primary Inferred Resource of 625,000 t @ 1.56% Cu and 1.6% Zn and subsequently defined reserves and undertook mining activities in 2006-7.
Geology	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	<ul style="list-style-type: none"> The Whundo project is a partially dismembered single horizon VMS deposit which plunges at 40° to the northwest extending to 15 m down plunge. Mineralisation in Whundo consists of 2 main units; fine to medium grained pyrite, sphalerite and chalcopyrite; massive pyrite and pyrrhotite with minor sphalerite and chalcopyrite. West Whundo has 2 main units well: layered pyrite, sphalerite and chalcopyrite with disseminated magnetite overlain by massive pyrrhotite and pyrite. Sulphide mineralisation consists mainly of chalcopyrite, chalcocite, sphalerite, pyrrhotite and pyrite
Drill hole Information	<ul style="list-style-type: none"> <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> 	<ul style="list-style-type: none"> Collar information for all drill holes reported is provided in the body of this report.

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> ○ hole length. • <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i> 	
Data aggregation methods	<ul style="list-style-type: none"> • <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i> • <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> • <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	<ul style="list-style-type: none"> • All intervals reported are composed of 1 metre down hole intervals for Reverse Circulation drilling, and lithologically intervals are used for Diamond core and are therefore length weighted. • No upper or lower cut-off grades have been used in reporting results. • No metal equivalent calculations are used in this report.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> • <i>These relationships are particularly important in the reporting of Exploration Results.</i> • <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> • <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i> 	<ul style="list-style-type: none"> • True widths of mineralisation have not been calculated for this report, and as such all intersections reported are down-hole thicknesses and compensated for in 3D for the resource modelling. • Due to the moderately to steeply dipping nature of the mineralised zones, it is expected that true thicknesses will be less than the reported down-hole thicknesses.
Diagrams	<ul style="list-style-type: none"> • <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should</i> 	<ul style="list-style-type: none"> • Appropriate maps and sections are available in the body of this report.

Criteria	JORC Code explanation	Commentary
	<i>include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> Reporting of results in this report is considered balanced.
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> There is no other relevant data to report on.
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (e.g. tests for lateral extensions, depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> The results at the Whundo project warrant a Whittle© mining study as part of a Pre-Feasibility study for mining the deposit.
