Cerro Leon drill results - Revised

18m at 601gpt AgEq intersected at Archen, extending high-grade mineralisation a further 50m vertically and remaining open at depth.

Unico Silver Limited (**"USL"** or **the "Company"**) is pleased to announce further assay results from ongoing drilling at the Cerro Leon project, located in the Santa Cruz province of Argentina.

HIGHLIGHTS

- **Drilling at Archen (Sierra Blanca) returns further exceptional high-grade mineralisation outside of the current Mineral Resource:**
    - **Highest silver equivalent (AgEq[1]) Grade Thickness to date of 10,825 GT**.
        - (P020-25) **3.2m at 265gpt AgEq** from 119m, and
          18m at 601gpt AgEq from 127m, inc.
          4m at 2,400gpt AgEq from 136m
- **Extends mineralisation 50m below previously reported intercept of 17m at 429gpt AgEq** (PR041-24) **and is open at depth.**
- **High grade silver mineralisation at Karina extended a further 50m vertical, open at depth.**
        - (P003-25) **19.8m at 125gpt AgEq** from 101m, and
          1.7m at 785gpt AgEq from 138.4m
- **Regional RC drilling defines new Silvia structure 6m at 308gpt AgEq from 48m.**
- **The planned 10,000m Phase 2 diamond drill program at Cerro Leon is almost complete and assay results for 49 holes for 6,879m are pending.**

Managing Director, Todd Williams: ***""I am pleased to report that drilling at Archen has confirmed a high-grade mineralised shoot with vertical dimensions of at least 125 meters, remaining open at depth. Notably, grades are increasing as we drill deeper, with exceptional gold intercepts, including individual assays returning up to 108 g/t Au. Importantly, all these newly identified intercepts lie outside our existing mineral resource, representing pure additional ounces and further reinforcing the project's strong exploration upside.***

This discovery underscores the significant potential for additional high-grade mineralisation within the underexplored western extension of the Cerro Leon vein field. At the same time, we are preparing to launch a regional exploration program across the broader Sierra Blanca property, aiming to generate a strong pipeline of surface targets for future drilling and systematically grow our resource base.

[1]See footnote Table 4 and 5

Summary

Unico Silver holds 100% of the Cerro Leon and Joaquin silver gold districts located in the central Deseado Massif geological province, Santa Cruz Argentina (Figure 1).

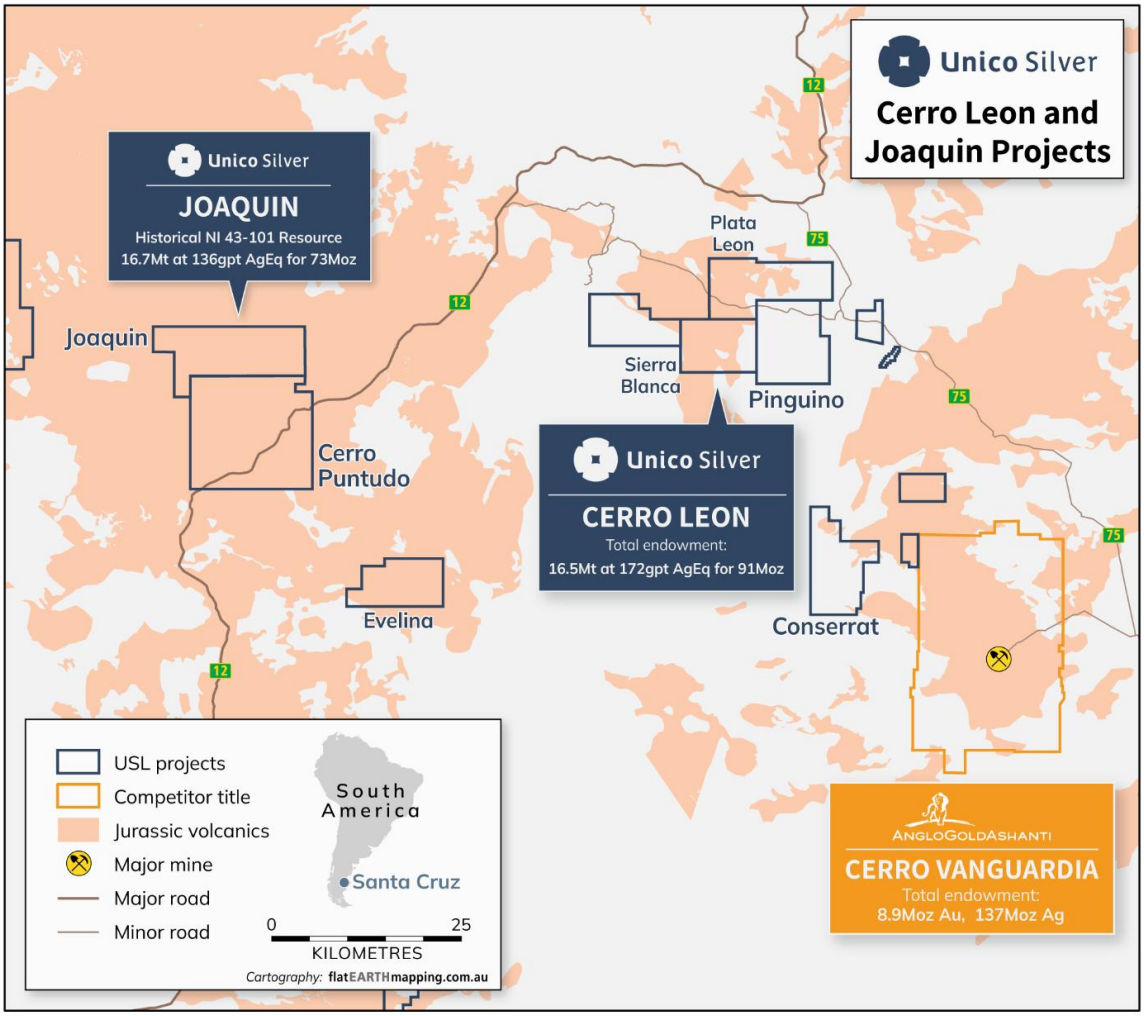

Figure 1: Joaquin and Cerro Leon project location

Cerro Leon is strategically located within the same structural corridor that is host to AngloGold Ashanti's world-class Cerro Vanguardia mine. The Project hosts a JORC compliant Mineral Resource Estimate (MRE) of **91Moz AgEq for 16.5Mt at 172gpt AgEq** (Table 3).

During August 2024, the Company announced the acquisition of the Joaquin project from Pan American Silver Corp (PAAS). Joaquin is host to a Foreign Estimate of **73Moz AgEq for 16.7Mt at 136gpt AgEq** (Table 4). Historical production by PAAS from 2019 to 2022 totals 4.3Moz Ag (Table 5).

Cautionary Statement

The Foreign Estimate of mineralisation included in this announcement is not compliant with the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves (2012 JORC Code) and is a "Foreign Estimate". An independent resource consulting group NCL Ingenieria y Construccion Ltda. was commissioned by Coeur D'Alene Mines Corporation to prepare an independent Technical Report on the Joaquin Project suitable for reporting purpose under the standards of NI 43-101. A Competent Person (under ASX Listing Rules) has not yet done sufficient work to classify the Foreign Estimate as Mineral Resources or Ore Reserves in accordance with the 2012 JORC Code. It is uncertain that following evaluation and/or further exploration work that the foreign estimates will be able to be reported as mineral resources or ore reserves in accordance with the JORC Code 2012.

The Phase 1 drill program was completed on 15 December 2024 and comprised 56 Reverse Circulation (RC) holes, totalling 4,847m. The program was designed to test shallow mineralisation (less than 75 vertical meters) across six prospects (*see ASX announcement, 9 October 2024, Priority Silver Targets Outlined at Cerro Leon*).

Assay results for the final 10 holes, totalling 938m, are now reported.

The Phase 2 diamond drill program commenced in early January 2025 and is set to conclude next week. Assay results have been received for a further 9 holes, totalling 1187m (see Tables 1 and 2), while results for an additional 49 holes totalling 6,879m are pending.

Although drilled later, assay results for the Veta Chala and Archen prospects were received first due to the prioritisation of fire assays for gold and silver at the Alex Stewart laboratory in Perito Moreno, Santa Cruz province. Samples are then transported to Mendoza for more detailed ICP-MS analysis of lead and zinc, which has extended turnaround times by approximately four weeks.

Table 1: Significant drill hole assay results

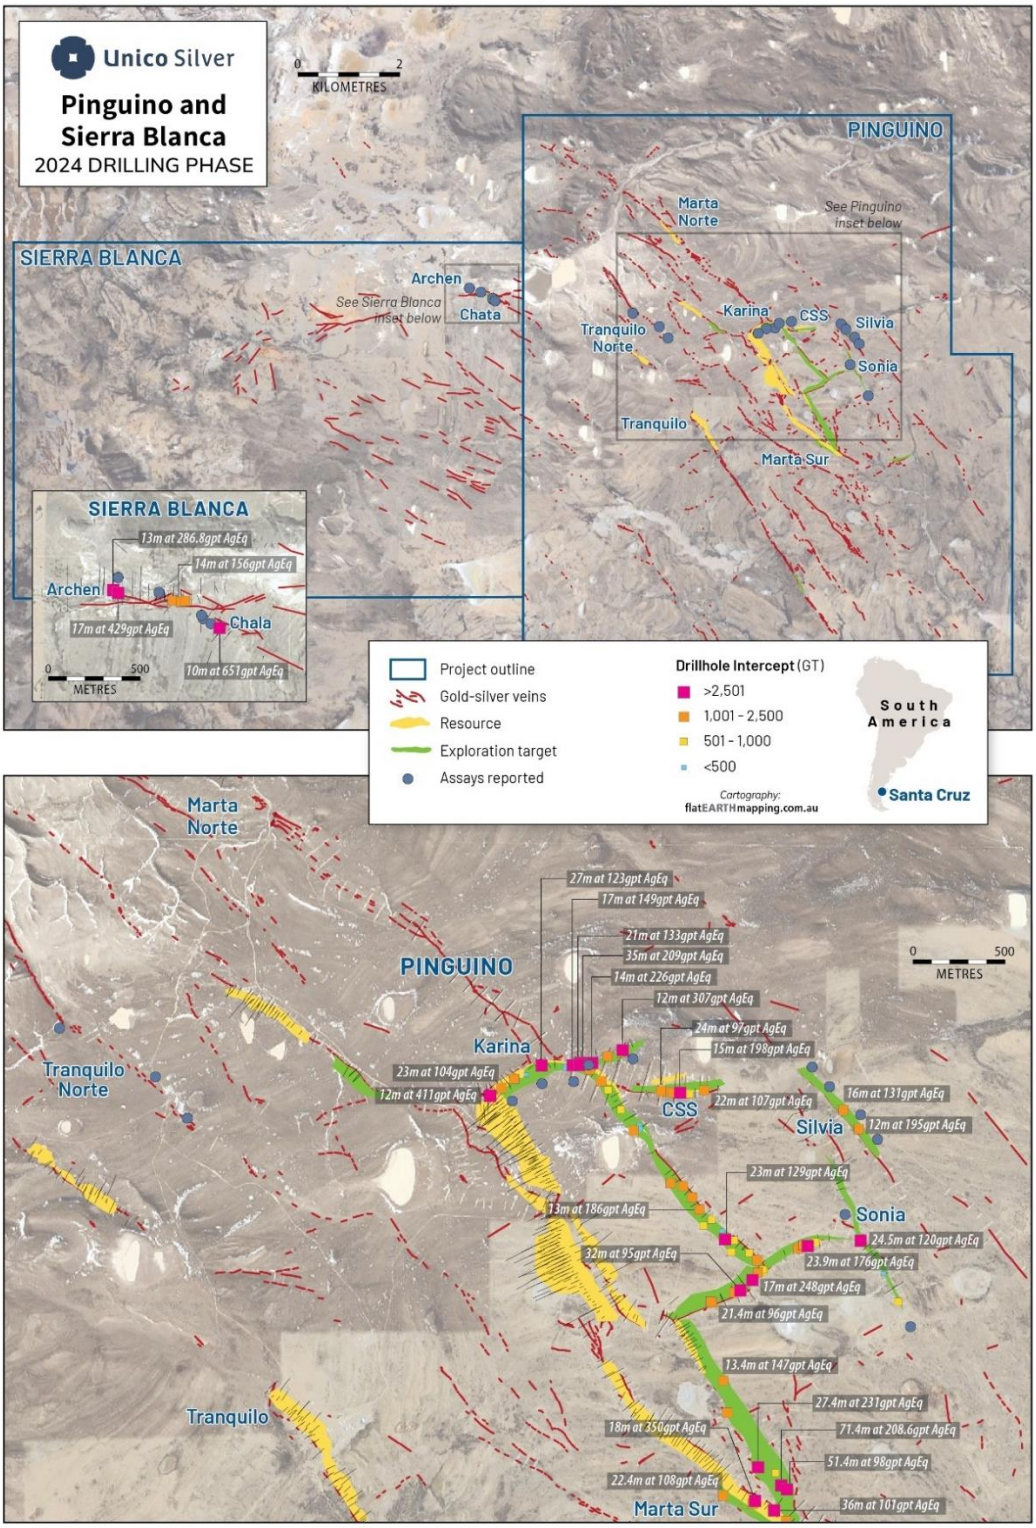

Figure 2: Cerro Leon – Sierra Blanca and Pinguino properties – Drill locations and results

Cautionary Statement: *The potential quantity and grade of the Exploration Target is conceptual in nature and as such there has been insufficient exploration drilling conducted to estimate a mineral resource. At this stage it is uncertain if further exploration drilling will result in the estimation of a mineral resource. The Exploration Target has been prepared and reported in accordance with the JORC Code (2012).*

SIERRA BLANCA PROPERTY

Archen-Chala Prospect

Five holes (P020-25 to P024-25) totalling 506m were completed at the Archen-Chala prospect (Figure 3-5).

Drilling at Archen was focused on following up a sub-vertical mineralised shoot, previously defined by two drill holes reported January 2025 (*see ASX Announcement, 20 January 2025, Cerro Leon drill results*)

Previously reported drill results for Archen include:

(PR041-24) **17m at 429gpt AgEq** from 95m, including
7m at 767gpt AgEq from 95m
(PR042-24) **13m at 287gpt AgEq** from 63m

Deeper drilling on the section returned exceptional high-grade mineralisation, extending the mineralised shoot 50m down dip, to 125m from surface.

New drill results from Archen include:

(P020-25) **3.2m at 265gpt AgEq** from 119m, and
18m at 601gpt AgEq from 127m, including.
4m at 2,400gpt AgEq from 136m

Mineralisation is hosted within a banded epithermal vein (silica-rhodochrosite) cut by black silica and minor sulfides. These results returned the highest AgEq Grade Thickness (GT) recorded for the project to date, with a value of 10,825 GT and an individual gold assay of 108 g/t Au.

Figure 3: Hole P020-25 epithermal vein returning 4m at 2,400gpt AgEq (29gpt Au, 38gpt Ag)

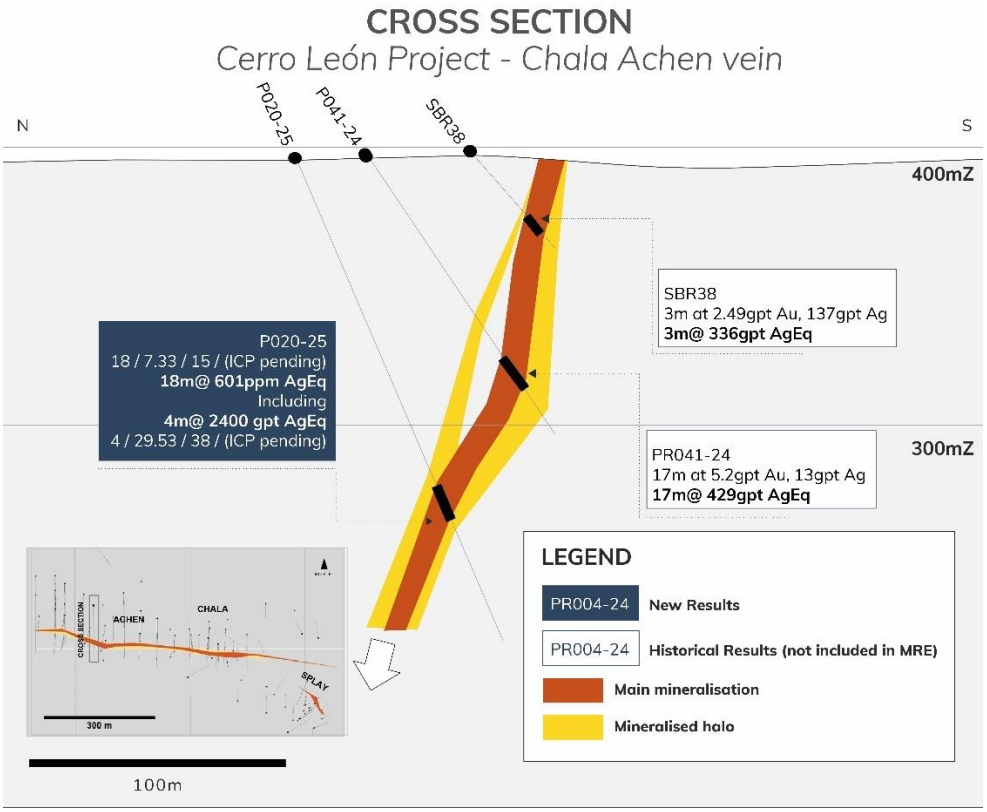

Figure 4: Archen cross section

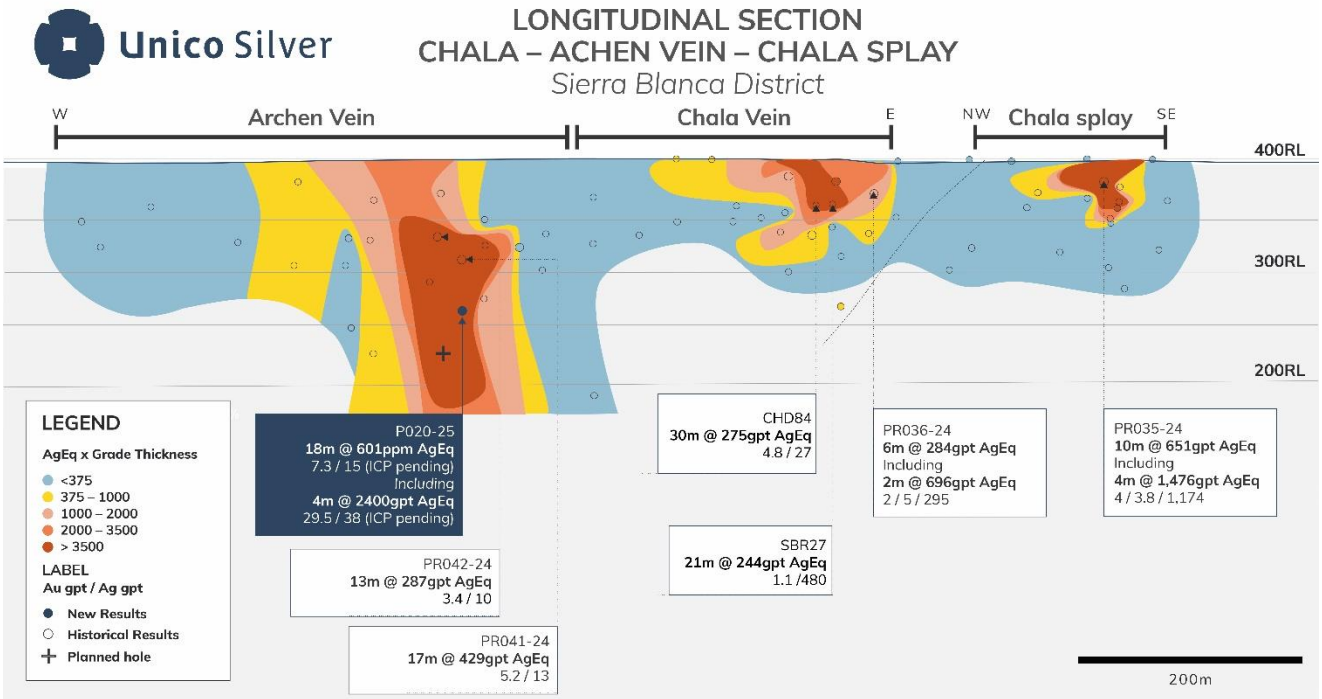

Figure 5: Archen long section

At Chala, drilling has defined a new hanging wall structure (Chala HW) that remains poorly tested by drilling. Hole P023-25 pierced Chala HW at shallow levels and returned **3m at 265gpt AgEq from 44m**. Three additional holes at Chala HW have been complete over a 200m strike to better define the structure.

PINGUINO PROPERTY

Karina Prospect

Four holes (P001-25 to P004-25) totalling 681m were completed at the Karina prospect. Initial holes were spaced up to 175m apart to test the vertical continuity of mineralisation.

Drill hole P003-15 intercepted broad mineralisation followed by a second high-grade footwall structure with high primary silver, confirming vertical continuity to mineralisation on this section (Figure 6).

Significant results include:

(P003-25) **19.8m at 125gpt AgEq** from 101m, and

1.7m at 785gpt AgEq from 138.4m

The results extend mineralisation a further 50m vertically to 125m below surface and is open at depth. Infill drilling is planned around hole P003-25 to better determine the geometry of the mineralised shoot.

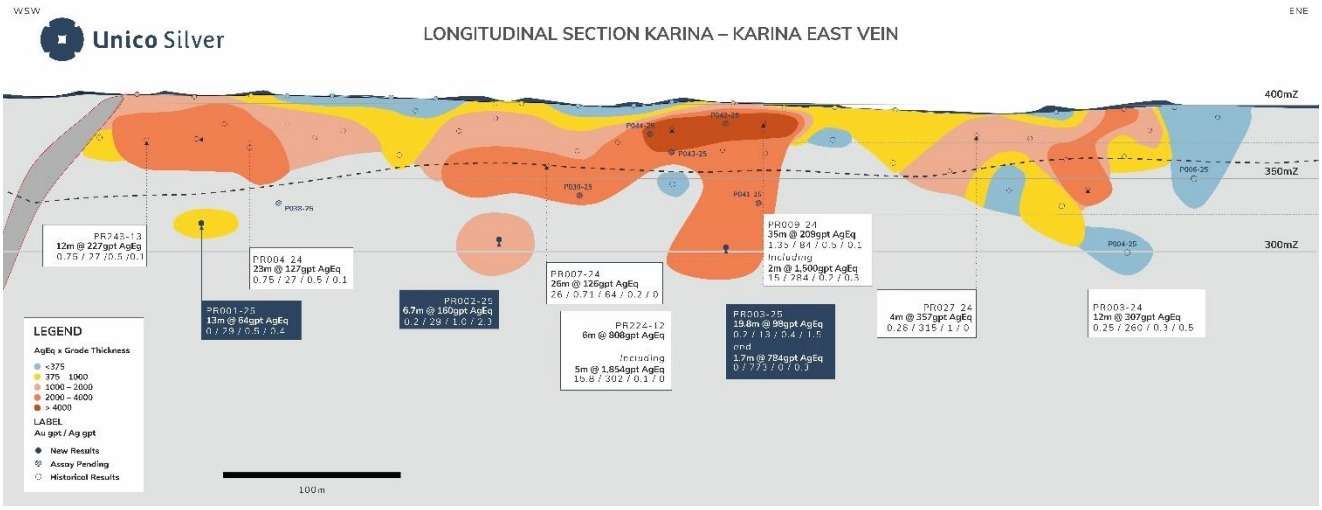

Figure 6: Karina long section

Regional Drilling

In addition to the recent Phase 2 diamond drilling, assay results for the last 10 regional RC drill holes totalling 836m were received. At Silvia, located on the eastern limits of the Cerro Leon vein field, has confirmed a new mineralised structure:

(PR050-24) **6m at 308gpt AgEq** from 54m

Mineralisation is open along strike and at depth. Two deep diamond drill holes have been completed at Silvia targeting extensions of mineralisation.

Elsewhere, drilling at Tranquilo Norte and CSV has returned encouraging mineralisation from 150m to 400m spaced reconnaissance holes, including:

Tranquilo	(PR053-24) **3m at 99gpt AgEq** from 48m
	(PR054-24) **12m at 55gpt AgEq** from 66m
CSV	(PR056-24).**4m at 153gpt AgEq** from 75m

Exploration at both prospects is ongoing.

Next Steps

The Archen discovery is significant and confirms the potential for the Sierra Blanca property and poorly explored western continuation of the Cerro Leon vein field to host high-grade mineralised shoots. Regional exploration, including detailed soil and rock chip sampling programs are underway to rapidly advance additional targets within Sierra Blanca to drill status.

Assay results for 49 holes totalling 6,879m are pending with further results are anticipated in 3 weeks.

The preceding statements of Mineral Resources conforms to the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code) 2012 Edition. The information in this announcement that relates to the current Mineral Resources for Cerro Leon has been extracted from the ASX release by Unico Silver entitled "Cerro Leon Resource Grows 84% to 92Moz" dated 18 May 2023, available at www.unicosilver.com.au and www.asx.com.au ("Unico Silver Announcement").Unico Silver confirms that it is not aware of any new information or data that materially affects the information included in the Unico Silver Announcement in relation to estimates of Mineral Resources and that all material assumptions and technical parameters underpinning the estimates continue to apply and have not materially changed. Unico Silver confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the announcement. Due to rounding to appropriate significant figures minor discrepancies may occur. Lead and Zinc credits are only considered for the Marta Centro prospect, all other prospects the Pb and Zn are attributed no economic value. Cerro Leon's reported silver equivalent (AgEq) is consistent with previous reports and is based on the following assumptions: AgEq = Ag (g/t) + 79.18 x Au (g/t) + 25.56 x Pb (%) + 39.41 x Zn (%), where: silver price is $23.5/oz and recovery is 95%, gold price is $1964/oz and recovery is 90%, lead price is $0.95/lb and recovery is 87.6% and zinc price is $1.39/lb and recovery is 92.3%.In the Company's opinion, the silver, gold, zinc, lead included in the metal equivalent calculations have a reasonable potential to be recovered and sold.

Table 4: Joaquin Project – Historical Foreign Estimate as of February 2013

Resource Category	Tonnes (Mt)	Ag (gpt)	Au (gpt)	Ag (Moz)	Au (Koz)	AgEq (gpt)	AgEq (Moz)
M&I	15.7	128	0.12	65.2	61.1	138	70.1
Inferred	1	100	0.12	3.1	3.7	110	3.3
Total	**16.7**	**126**	**0.12**	**68.3**	**64.2**	**136**	**73.4**

The estimates of mineralisation in respect of the Joaquin Project included in this announcement are foreign estimates and are not reported in accordance with the Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves (2012 JORC Code) and is a "Foreign Estimate". Unico Silver confirms that it is not aware of any new information or data that materially affects the information included in the Foreign Estimate and that all material assumptions and technical parameters underpinning the estimates continue to apply and have not materially changed. Unico Silver confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the announcement. A Competent Person has not yet done sufficient work to classify the Foreign Estimate as Mineral Resources or Ore Reserves in accordance with the 2012 JORC Code. It is uncertain that following evaluation and/or further exploration work that the Foreign Estimates will be able to be reported as mineral resources or ore reserves in accordance with the JORC Code 2012. Joaquin's reported silver equivalent (AgEq) is based on the following assumptions: AgEq = Ag (g/t) + 79.18 x Au (g/t) where: silver price is $23.5/oz and recovery is 95%, gold price is $1964/oz and recovery is 90%. In the Company's opinion, the silver and gold included in the metal equivalent calculations have a reasonable potential to be recovered and sold.

COMPETENT PERSON'S STATEMENT

Exploration Results

Information in this report that relates to Exploration Results and Targets is based on, and fairly reflects, information compiled by Unico Silver Limited and Todd Williams, a Competent Person who is a Member of the Australian Institute of Geoscientists. Mr. Williams is the Managing Director to Unico Silver Limited and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity, which he is undertaking to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr. Williams consents to the inclusion of the data in the form and context in which it appears.

Exploration Target

Information in this report that relates to Exploration results and targets is based on, and fairly reflects, information compiled by Unico Silver Limited and Todd Williams, a Competent Person who is a Member of the Australian Institute of Geoscientists. Mr. Williams is the Managing Director to Unico Silver Limited and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity, which he is undertaking to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr. Williams consents to the inclusion of the data in the form and context in which it appears.

Methodology

Exploration targets for Cerro Leon were generated as follows:

- Field geological maps reviewed in GIS spatial software to measure total cumulative strike of prospective veins and vein corridors and determine % tested by drilling.
- Conversion of tested veins in to JORC (2012) resources.
- Dimensions of mineralised structures are consistent with current resources and assumed to be 800 – 1000 m strike with mineralised shoots that range from 500 – 700 m strike length (Table 5).
- Vertical continuity of mineralised shoots is assumed to be between 160 - 300 m RL from surface and up to 550 mRL in punctual cases (Martha Centro) where the deeper mineralisation is confirmed by drilling.
- The tonnes range, grades and other metrics applied used were obtained from the information provided by the database, exploration works developed, 3D geological models, statistics performed during estimations, and analysis of the historical information available.
- All 3D volumes are assigned a Specific Gravity (SG) of 2.5 which is the average value for the Cerro Leon MRE and does not consider denser polymetallic mineralisation (SG=3).
- Exploration Target prospects include 213 historical RC and Diamond drill holes totalling 21,000m.

The Exploration Target has been prepared and reported in accordance with the 2012 edition of the JORC Code. The potential quantity and grade of the Exploration Target is conceptual in nature. There has been insufficient exploration to estimate a Mineral Resource. It is uncertain if further exploration will result in the estimation of a Mineral Resource.

Cerro Leon

Information in this announcement that relates to the estimate of Mineral Resource for the Cerro Leon Project (geological interpretation and resource estimates) is based upon, and fairly represents, information and supporting documentation compiled by Mr. Ian Taylor BSc (Hons). Mr Taylor is an employee of Mining Associates Pty Ltd and has acted as an independent consultant on Unico Silver's Cerro Leon Project, located in the Santa Cruz province of Argentina. Mr Taylor is a Fellow and certified Professional of the Australian Institute of Mining and Metallurgy (110090) and has sufficient experience with the style of mineralisation, the deposit type under consideration and to the activity being undertaken to quantify as a Competent Person as defined in the 2012 Edition of the "Australasian Code For Reporting of Exploration Results, Mineral resources and Ore Reserves" (The JORC Code). Mr Taylor consents to the inclusion in this announcement of the matters based upon this information in the form and context in which it appears.

Joaquin

The information in this announcement relating to Mineral Resources estimates for Joaquin is based on the technical report titled "Joaquin Project, Santa Cruz, Argentina, Technical Report" with an effective date of 15 February 2013 which was prepared in accordance with NI 43-101 and is available on www.sedarplus.ca. The technical information for the Joaquin mineral resource has been prepared by NCL Ingenieria y Construction Ltda. in accordance with Canadian regulatory requirements set out in NI 43-101. Luis Oviedo H is the Independent Qualified Person responsible for the preparation of the Report, as defined in CIM Code and the NI 43-101. In his 37 years of industry experience Mr. Oviedo accumulated relevant expertise in the exploration and evaluation of silver deposits of similar geology as Joaquin project. The author visited the property from 17 to 21 January 2012.

FORWARD LOOKING STATEMENT

Certain statements in this announcement constitute "forward-looking statements" or "forward looking information" within the meaning of applicable securities laws. Such statements involve known and unknown risks, uncertainties and other factors, which may cause actual results, performance or achievements of the Company, or industry results, to be materially different from any future results, performance or achievements expressed or implied by such forward-looking statements or information. Such statements can be identified by the use of words such as "may", "would", "could", "will", "intend", "expect", "believe", "plan", "anticipate", "estimate", "scheduled", "forecast", "predict" and other similar terminology, or state that certain actions, events or results "may", "could", "would", "might" or "will" be taken, occur or be achieved. These statements reflect the Company's current expectations regarding future events, performance and results, and speak only as of the date of this announcement. All such forward-looking information and statements are based on certain assumptions and analyses made by USL's management in light of their experience and perception of historical trends, current conditions and expected future developments, as well as other factors management believe are appropriate in the circumstances.

JORC Code Reporting Criteria

SECTION 1 SAMPLING TECHNIQUES AND DATA

	JORC Code Explanation	Comments
SAMPLING TECHNIQUES	• Nature and quality of sampling (e.g. cut channels, random chips, or specific specialized industry standard measurement tools appropriate to the minerals under investigation, such as handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representativity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralization that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. "RC drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay"). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information	**RC Drilling** • 1m samples are collected in a cyclone, with the output collected in bags before being passed through a riffle splitter. Samples are split into two portions of approximately 75% and 25% and are passed through two outlets into plastic bags (dry samples) or micro-porous bags (wet samples). For wet samples, Hydraulic Cone Splitter is used. • For dry RC drilling a scoop of material was taken from the backup sample for geological logging, and for wet samples some material was screened then washed, dried and then logged. • Sample interval is defined by geologists based on geological observations. **Diamond Drilling** • Drillholes were orientated to intersect mineralisation as close to perpendicular as possible. • Drill core was placed in wood trays and meterage blocks were inserted at the end of each run. This was reviewed by a geologist. • Core was measured for recovery and RQD, the geologist logged the core and marked sample intervals, with the sample cut plan marked as normal to the structural trend. • Each sample was then 'half-cored', with one half going into sample bags for each interval. The remaining half of the sawn core was returned to the original box and retained for archival purposes. • These sample bags were stored in a closed room at the camp until they were sent to the lab in rice bags sealed with tamper-proof closure straps. • Core was logged and sampled on site at the Company's logging facilities by employees trained by the company. • The core is cleaned, realigned and pieced back together before being measured for recovery and RQD information. RQD measurements have not identified any effects on sample quality.

	JORC Code Explanation	Comments

		QAQC
		• A QAQC sample are inserted at the following frequency of primary samples:
		  • Blanks: 1 in 50
		  • Duplicates: 1 in 20
		  • Standards: 1 in 25
		• Appropriate certified reference materials were supplied by OREAS Ptd Ltd and Blank material used is basalt.
		• Analysis of QAQC material is undertaken to verify laboratory results.
		• Alex Stewart Laboratories also performed internal checks including insertion of pulp duplicate, standard and repeat samples as required.

DRILLING TECHNIQUES	• Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	**RC Drilling** • The reverse circulation percussion (RC) method used in this program used a 5.25" (13.3cm) face sampling bit. **Diamond Drilling** • The diamond drilling has a HQ diameter and HQ3 diameter for mineralized zones.
DRILL SAMPLE RECOVERY	• Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	**RC Drilling** • Sample recovery was monitored constantly on site by a Unico Silver representative. Samples are weighing beside the drill rig if the samples were dry, if the samples were wet the geologist would wait till the samples were dry before weighing. Additionally, the operations are controlled, and the chip samples are collected by technical staff and / or geologists of Unico Silver. Logging and sampling interval is defined by geologists. • Drill rig is oriented in azimuth and dip by Unico Silver geologists. • The samples are collected in 1 metre interval from surface to endo of hole. **Diamond Drilling**

	JORC Code Explanation	Comments
		• Diamond drill core recoveries were assessed using the standard industry best practice which involves: - Measuring core lengths with a tape measure. - Removing the core from the split inner tube and placing it carefully in the core box. - Assessing recovery against core block depth measurements. - Measuring RQD, recording any measured core loss for each core run. • All core was carefully placed in HQ sized core boxes and transported a short distance to a core processing area were logging and photography could be completed.
LOGGING	• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. • The total length and percentage of the relevant intersections logged.	• Systematic geological logging was undertaken using a hand lens and electronic lens to closely examine the chips and cores. Data collected includes: • Host rock lithologies and determination of formational units • Relationship between lithologies. • Alteration extent, nature, and intensity. • Oxidation extent, mineralogy, and intensity. • Sulphide types and visually estimated percentage. • Quartz vein, veinlets, breccia types and visually estimated percentage. • Structure's occurrence and attitude. • Both qualitative and quantitative data is collected, though quantitative data is based on visual estimates, as described above. • All holes are logged from start to finish and were conducted on drill site. During 2024 the RC holes were logged in 1 metre interval, hole complete. • Both qualitative and quantitative data is collected, using predefined logging codes for lithological, mineralogical, and physical characteristics. • Cores and rock chips are photographed after logging, with sample marked in the boxes.

	JORC Code Explanation	Comments
		• Cores are photographed after logging, with sample numbers marked in the boxes, before and after being cut and sampled.
SUBSAMPLING TECHNIQUES AND SAMPLE PREPARATION	• If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. • For all sample types, the nature, quality, and appropriateness of the sample preparation technique. • Quality control procedures adopted for all subsampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled.	**RC Drilling** • Sample recovery was monitored by weighing sample bags on scales beside the drill rig if the samples were dry, if the samples were wet the geologist would wait till the samples were dry before weighing. • The recovery average is ~90% assuming that 33kg of material represent 100% of recovery. • The riffle splitter was cleaned with compressed air between samples to prevent sample contamination. • Samples are processed in two stages: first the 100% of the sample material es splitting to obtain two samples (50% each one). Second step is about to splitting one of the samples, in order to obtain two 25%, samples. • Total of samples: 3 bags, one of 50% material (called ¨reject¨), and two additional samples (25% each one) called original sample and duplicate. • Original samples are submitted to the laboratory. Duplicate is shipment to the laboratory to QAQC control and ¨reject¨ is preserved as backup. The bags are weighting in order to ensure the correct distribution of material in reject, original and duplicate samples. • Samples are preserved in a shed, in big bags labelled. Big bags and the samples contained are registered in photos and in specific spreadsheet. • After the reception of analysis, the pulps and reject material from the laboratory is received. Pulps are stored in core shake. sample bags derived from the initial RC rig cyclone and riffle splitting reach a weight of 5 – 7 Kg, to ensure the representativity of the sample. **Diamond Drilling** • All core was carefully placed in HQ sized core boxes and transported a short distance to a core processing area were logging and photography is completed by geologists. • The core intervals were marked, and the core was split with a wet cut bench saw. • Half core samples were placed in plastic bags and tagged with a unique sample number. The other half of the core was returned to the core box and securely stored.

	JORC Code Explanation	Comments
		Laboratory Method • Samples are transported by courier from camp to laboratory Alex Stewart, located in Perito Moreno City. • Laboratory confirm the correct reception of bags immediately are received and then the laboratory store the samples in specific facilities, previous to be analysed. • Samples are analysed under Au4-50+Ag4-50 and ICP-MA39 in Alex Stewart Laboratory facilities. • In the Alex Stewart preparation laboratory facilities samples were dried and crushed until more than 80% is finer than 10 mesh size, then a 600g split obtained by riffle splitting is pulverized until 95% is finer than 106 microns. • Four acid digest and ICP-MS is the most robust analytical method for full digestion and quantitative analyses of multi-element concentrations. • Analysis of 39 elements, dissolution of 0.2g in 4 acids: hydrofluoric, perchloric, nitric and hydrochloric (total digestion with partial loss by volatilization of As, Cr, Sb and Hg). Determination in ICP-OES. • Assays are reported by the laboratory, as csv files and pdf certificates.
QUALITY OF ASSAY DATA AND LABORATORY TESTS	• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and	• No geophysical tools were used in the determination of the assay results. All assay results were generated by Alex Stewart laboratory as described above. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols are stored at the Pingüino core shed and offices on site. Digital forms are saved into a secure database. • Standards are purchased from a Certified Reference material manufacture company – Ore Research and Exploration. • Standards were purchased in foil lines packets of between 60g and 100g. Different reference materials were used to cover high grade, medium grade and low grader ranges of gold and silver. • The standard names on the foil packages were erased before going into the pre-numbered sample bag and the standards are submitted to the lab blind. • In batches where all of the samples are from un-mineralised rock, if one standard fails and additional standards, blanks and duplicate data are all within limits, the batch is not rerun. • Failure limit is three times the standard deviation.

	JORC Code Explanation	Comments
	precision have been established.	• Results of standards were reviewed separately. • Blanks are fresh basalt material collected from the field. Results and reviewed separately.
VERIFICATION OF SAMPLING AND ASSAYING	• The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data.	**Significant Intersections** • Assay results for significant intercepts are prepared by site geologists and checked by Unico Silver's Certified Person and Exploration Manager. • Samples that make up the significant intercept are checked in the field. **Documentation and data entry** • Samples logs are recorded on paper log sheets in the field and uploaded into the database. • Geological log data is verified in 3D software (Micromine and Leapfrog) • Field data is backed up and stored in the Company database and hosted on a server. • Laboratory data is provided electronically and validated then uploaded to the Company database.
LOCATION OF DATA POINTS	• Accuracy and quality of surveys used to locate drillholes (collar and downhole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	• Drill hole collars are located using Garmin hand-held GPS accurate to ±5m. • All coordinates are based on UTM Zone 19S using a WGS84 datum. • Topographic control to date has used GPS data, which is adequate considering the small relief (<50m) in the area. • Prior to incorporating any holes into a Mineral Resource, a differential GPS will be used by a qualified surveyor to increase accuracy of the collar locations.

DATA SPACING AND DISTRIBUTION	• Data spacing for reporting of Exploration Results.
	• Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.
	• Whether sample compositing has been
		• Drilling is complete on the following drill section spacing:
		  ○ Reconnaissance: 400m to 200m spaced sections
		  ○ Exploration: 150m spaced sections
		  ○ Infill: 75m spaced sections
		  ○ Mineral Resource: 25 to 75m spaced sections
		• This drill spacing is considered appropriate for the deposit style

	JORC Code Explanation	Comments
	applied.	
ORIENTATION OF DATA IN RELATION TO GEOLOGICAL STRUCTURE	• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	• Drill sections are orientated perpendicular to the structures and varies locally quite considerably. Drill sections are commonly orientated perpendicular to the main mineralised lodes. • No known bias has been introduced into the drilling orientation.
SAMPLE SECURITY	• The measures taken to ensure sample security.	• Sample bags were shipped by truck from camp to Laboratory in Perito Moreno. For samples analysed under ICP-39 elements analysis the pulps are shipped to the Alex Stewart laboratory in Mendoza from the Alex Stewart Laboratory of Perito Moreno city.
AUDITS OR REVIEWS	• The results of any audits or reviews of sampling techniques and data.	• During 2023 Mining Associates (MA) completed a detailed audit of historical Information, Including visit at the project, reviewing cores, trenches. • For the current program, an audit is planned on completion of the drill program prior to calculating and independently verified Mineral Resource.

SECTION 2 REPORTING OF EXPLORATION

<table>
<tr><th>Criteria</th><th>JORC Code Explanation</th><th>Comment</th></tr>
<tr><td>MINERAL TENEMENT AND LAND TENURE STATUS</td><td>• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.
• The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.</td><td>• Unico Silver has 100% ownership in the following exploration titles that make up the Cerro Leon project:
<table>
<tr><th>Tenure</th><th>Title ID</th></tr>
<tr><td>Cañadon</td><td>405.336/SCRN/2005</td></tr>
<tr><td>Linguino</td><td>414.409/CID/2000</td></tr>
<tr><td>Tranquilo I</td><td>405.334/SCRN/2005</td></tr>
<tr><td>Tranquilo II</td><td>405.335/SCRN/2005</td></tr>
<tr><td>Sierra Blanca I</td><td>425.588/IAM/09</td></tr>
<tr><td>Sierra Blanca II</td><td>425.899/MMA/10</td></tr>
<tr><td>Sierra Blanca III</td><td>442.900/MMA/10</td></tr>
<tr><td>Sierra Blanca IV</td><td>441.504/SB/19</td></tr>
<tr><td>Sierra Blanca V</td><td>423.273/SB/07</td></tr>
</table></td></tr>
<tr><td>EXPLORATION DONE BY OTHER PARTIES</td><td>• Acknowledgment and appraisal of exploration by other parties.</td><td>Pinguino
• Exploration by Mincorp under the project name “Cerro Leon” Cerro Leon Trenching
○ 168 trenches were cut which were all less than 30m in length, covering 10 veins with 40m between trenches on individual veins (Tranquilo, Marta Sur, Ivonne Sur, Ivonne, Sonia, Marta Centro, Marta Este, Marta Oeste, Marta Noroeste, and Marta Norte). Cerro Leon Drilling
○ 17 HQ core holes drilled for a total of approximately 1,000 m.
• Exploration by Argentex, project renamed to Pingüino. Pingüino
○ Soil Sampling 156 line-kilometer grid, with lines spaced 100m apart and samples taken every 50m (2004).
○ Infill sampling was later completed on 25m spacing (2005).</td></tr>
</table>

Criteria	JORC Code Explanation	• Comment
		○ The number of soil samples collected in 2004-2005 range from 3,625 to 3,935. ○ Samples were analyzed for 36 elements by ICP. ○ Further sampling was completed in 2009 to 2011 with 3,291 sampled collected and analysed for Ag, As, Au, Cd, Pb, Sb, W and Zn. ○ 1,123 samples were collected in 2009 and analyzed for multiple elements. Pingüino Trenching and Channel Sampling ○ In 2004, between 114 and 186 further trenches were cut by Argentex in 2004 to test soil geochemical anomalies. ○ In 2006, 17 channel trenches were completed, and in 2007, extensions were made on 13 Marta Centro trenches previously completed by Mincorp and by Argentex in 2004 and were sampled and analyzed, including for indium. 20 new trenches were completed based on IP chargeability anomalies and gossan zones, resulting in the discovery of 6 new polymetallic veins. ○ In 2009-2010 and 2010-2011 247 trenches were completed totaling 14,638m, and in 2011-2012 186 trenches were completed totaling 21,901m. A further 122 trenches totaling 6,453 were also later completed. ○ The drill-hole databased used for the resource estimation is compose of the 735 holes drilled by Argentex. ○ Drillholes were orientated to intersect mineralisation as close to perpendicular as possible. Pingüino Geophysics. • From 2014 to 2022 the property owned by ASX company Austral Gold Limited. Limited exploration works were completed. • Uncio Silver acquired the Pinguino project from Austral Gold in March 2023. A revised MRE was reported May 2023. **Sierra Blanca** • Sierra Blanca was staked in 2004 by IAMGOLD Gold Corporation (IAMGOLD). Work Completed included: ○ Landsat hyperspectral clay alteration studies ○ Reconnaissance rock chip sampling (n=422)

Criteria	JORC Code Explanation	• Comment
		• Mariana Resources Limited (Mariana) entered a Joint Venture (JV) with IAMGOLD to earn up to 70% of the project. The JV covered the Sierra Blanca and nearby Cruz del Sur mining properties. Mariana completed three phases of drilling during 2007, 2008 and 2011. In February 2012, Mariana consolidated ownership of Sierra Blanca and acquired the remaining 30% interest from IAMGOLD. Completed works included: ○ 1:10,000 scale geological mapping, surface sampling ○ 21.2-line km of pole dipole IP ground geophysics at Chala, Lucila, Trafwe and Vetarron. ○ 38 trenches for 1022m and 136 drill holes for 17,949m. • During 2017, Mariana was acquired by Sandstorm Gold Limited for US$175m. Subsequently in May 2018, New Dimension (now Capella Minerals) acquired a 100% interest in the Sierra Blanca from Sandstorm Gold Limited (Sandstorm) for C$400k in cash or shares and a 2% Net Smelter Return on the project. • During April 2020, Austral Gold entered an agreement* with Capella Minerals to purchase up to an 80% interest in the Sierra Blanca project for USD$ 800k in cash and work commitments. Currently, Austral Gold hold 54% of the Sierra Blanca project via the company's ownership in Argentine subsidiary Sierra Blanca SA (SBSA). • During October 2020, Capella Minerals entered separate agreements** with IAMGOLD and Sandstorm that provide Sierra Blanca SA with options to acquire one-half of their respective royalties on the Sierra Blanca project. The agreement with IAMGOLD provides SBSA the option to acquire one half (0.75%) of its 1.5% NSR for CAD $750,000 at any time prior to the commencement of commercial production. • The agreement with Sandstorm provides SBSA the option to acquire one-half (1%) of its existing 2% NSR for CAD $1,000,000 at any time prior to the commencement of commercial production.
GEOLOGY	• Deposit type, geological setting and style of mineralisation.	**Santa Cruz Geology and Deposit Model** Pingüino and Sierra Blanca are located close to the centre of the large, relatively undeformed and stable Deseado Massif, which covers an area of approximately 100,000 square kilometres stretching across southern Argentina into the Chilean southern Andres. This massif is comprised of middle to late Jurassic andesitic-rhyolitic lavas, tuffs, and ignimbrites, overlying pre-Jurassic low-to-high-grade metamorphic basement rocks and younger continental sedimentary sequences. Mesozoic volcanic rocks are broken by regional fractures, including north-northwest-trending faults which were active during the period of intense Jurassic extension and volcanism. Successive normal faulting trends predominantly in a northwest and east-northeast orientation, however the Jurassic rocks are relatively undeformed. Pingüino is centred on a regional dome, with the oldest rocks being middle to upper Triassic continental

Criteria	JORC Code Explanation	• Comment
		sedimentary rocks of the El Tranquilo Group. Dioritic bodies and associated mafic sills and dikes intrude the Triassic rocks and are part of the Jurassic La Leona Formation. These units are overlain by the lower Jurassic epiclastic and volcaniclastic rocks of the Roca Blanca Formation (the most extensive rock unit in the Pingüino area). This sequence is overlain by the lower Jurassic basalt flows of the El Piche Formation and ultimately by the middle Jurassic andesitic porphyries and lava flows (correlated to the Cerro Leon and Bajo Pobre Formations). Mineralisation at Pingüino is hosted with in the Roca Blanca Formation and the El Tranquilo Group and occurs in multiple veins which are clustered into three principal orientations of 330°, 300° and 70°. These veins form a system measuring 14.5km long by 4km wide, with approximately 113km of mapped vein, breccias, gossans and stockworks strike length in more than 70 veins. Veins are often more than a meter wide and range in length from hundreds of meters to kilometres. Vein styles include Ag-Au quartz rich, Ag quartz-rich veins, Ag-In-Zn-Pb polymetallic veins, Au-In-Cu polymetallic veins and Ag-rich quartz veins with polymetallic vein clasts.
DRILL HOLE INFORMATION	• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: • Easting and northing of the drill hole collar • Elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar • Dip and azimuth of the hole • Down hole length and interception depth • Hole length If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the	• Significant intercepts and drill hole information is provided in Table 1 and 2. • Length corresponds to the interval surveyed along hole trace. • Coordinates a stated in Datum WGS 84, UTM zone 19S

Criteria	JORC Code Explanation	Comment
	case.	
DRILL AGGREGATION METHOD	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	• Cerro Leon's reported silver equivalent (AgEq) is consistent with previous reports and is based on the following assumptions: AgEq = Ag (g/t) + 79.18 x Au (g/t) + 25.56 x Pb (%) + 39.41 x Zn (%), where: silver price is $23.5/oz and recovery is 95%, gold price is $1964/oz and recovery is 90%, lead price is $0.95/lb and recovery is 87.6% and zinc price is $1.39/lb and recovery is 92.3%. • Metal Equivalents are independently verified by Mining Associates and based on historical metallurgical test work. • Mineralised drill hole intercepts are calculated using greater than 50gpt AgEq with no more than 3m of internal dilution.
DIAGRAMS	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. • Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	• Drill holes with reported assays are shown in Figure 2.
BALANCED REPORTING	• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration	• Where high grades are present, subset intervals are provided to demonstrate the influence of high grades on total metal budgets of stated drill hole intercepts. • Qualification of true widths are provided in the drill hole discussion.

Criteria	JORC Code Explanation	• Comment
	Results.	
OTHER SUBSTANTIVE EXPLORATION DATA	• Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	• Exploration at all prospects discussed in this announcement is of an early stage and technical studies will commence once resource potential is established following deeper diamond drilling
FURTHER WORKS	• The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).	• Drilling is ongoing and will be dynamic, to optimise the discovery of new veins, expanding the dimensions of known mineralised veins along strike and down dip in addition to infill drilling to improve resource confidence.
