ASX Announcement

MAGNETITE EXPLORATION TARGET OF 1.75Bt – 3.25Bt IDENTIFIED AT GUM CREEK PROJECT

- Magnetite associated with 20km strike length of Banded Iron Formation (BIF) at Woodley
- A grade of 30-40% Fe (average 34%) is expected based on previous non-systematic rockchip of the outcropping portion of BIF

Legend Mining Limited (Legend) today announced the results of a magnetic modelling report by independent geophysical consultants, Southern Geoscience Consultants (SGC), evaluating the magnetite potential of its Woodley prospect at Gum Creek, see Figure 1.

The report focussed on a 20km strike length of BIF and indicated the potential for a range of 1.75-3.25Bt¹ of magnetite. An expected grade of 30-40% Fe (average 34%) is considered likely based on 48 non-systematic rockchip samples of outcropping BIF taken by Legend and reported previously to the ASX on 4 August 2008.

Legend Managing Director Mr Mark Wilson said, “Having identified this target the next stage is to plan an initial drilling programme to test the modelled targets, whilst considering all options”.

Technical Discussion

Forward-modelling (35 forward models) and 3D-inversion modelling (one model) techniques were used by SGC to model 100m line spaced aeromagnetic data over the Woodley BIF. The magnetic modelling was aimed at providing estimates of the thickness, depth to top and magnetic properties of the BIF, then using these estimates to calculate a volume and tonnage for the BIF.

The models along with images created from the magnetic data have been used to calculate a global tonnage estimate of 2.5Bt for the magnetic portion of the BIF. This estimate has a perceived error of ±30%, giving a potential tonnage range of 1.75Bt – 3.25Bt.

¹ SGC consider the global tonnage estimate to equate to 2.5Bt with a perceived error of ±30% (1.75Bt to 3.25Bt). The tonnage estimate is calculated down to a vertical depth of 250m below surface and assumes a density of 3.3g/cm³.

The tonnage estimate is calculated over a 20km strike length, to a vertical depth of 250m below surface and assumes a density of 3.3g/cm³. The forward models created from profiles of the total magnetic intensity and analytical signal data are well constrained and compare well with the 3D model, providing a good indication of the overall size and attitude of the magnetic BIF. The model results indicate that the BIF sequence is comprised of up to four separate magnetic units with depths between 10-100m below surface.

Figure 2 shows the location and extents of the modelled profiles on an image of the analytical signal of total magnetic intensity for the 20km of BIF. Full details of the forward modelling are also presented in Table 1.

Previous non-systematic rockchip sampling (110 samples) over Woodley was reported to the ASX on 4 August 2008. Of these 110 samples, 48 samples were of outcropping BIF with a range in iron grade of 30-40% Fe and an average of 34% Fe, see Figure 3. (Higher grade samples of goethitic and/or hematitic material potentially representing surficial carapaces with limited depth extent were not included in this group of samples).

The 30-40% Fe grade range indicated by these BIF rockchip samples is consistent with iron grades from magnetite deposits in the Yilgarn District; i.e. Jack Hills Deposit - 2.86Bt @ 30.6% Fe (Crosslands Resources Limited ASX announcement: 22 December 2009), Cashmere Downs Deposit - 822Mt @ 32.5% Fe (Cashmere Iron Limited website, unlisted public company) and Karara Deposit - 1.85Bt @ 35.4% Fe (Gindalbie Metals Limited ASX announcement: 4 August 2008).

Background

Legend currently holds interests in an iron ore Project in Cameroon, West Africa, and three Projects in WA, namely, Pilbara, Mt Gibson and Gum Creek.

The Cameroon Project (iron ore, gold) comprises granted exploration permits and applications covering an area of approximately 3,900km². Discovery of 50Mt of direct shipping ore (DSO) is the primary target, however itabirite ore (lower grade but potential very high tonnage) will also be targeted. The southern project area has the added advantage of being well served by access infrastructure including rail and road networks to and from the port city of Douala.

The Pilbara Project (iron ore, nickel-copper, zinc-copper) comprises 686km² of tenure in the West Pilbara, all within 50km of Karratha. As well as the magnetite potential associated with BIF of the Cleaverville Formation, Legend has identified 14 priority base metal drill targets from Versatile Time-Domain Electromagnetic (VTEM) surveys.

The Mt Gibson Project (zinc-copper-gold) is located 290km northeast of Perth in the Murchison Province. Mt Gibson operated for 12 years as a gold mine from 1986 following the discovery of gold in surface laterite. The operation produced 870,000 ounces of gold from 16.5Mt of ore at an average grade of 1.68g/t. Legend, through a study conducted in 2006 by Dr S Carras of Carras Mining Pty Ltd, estimated the residual gold Mineral Resource (Indicated and Inferred) to be 8.7Mt at 1.98g/t gold for 559,000 ounces (see 2006 Legend Annual Report).

The Gum Creek Project (iron ore, nickel-copper-platinum group element) is located 640km northeast of Perth in the Yilgarn Province. The Woodley region contains a 22km BIF unit with the potential for a significant tonnage of magnetite. The project is also considered prospective for intrusion-related (Ni-Cu-PGE).

Legend Mining Limited
Ph: (08) 9212 0600

Competent Person Statement

The information in this announcement that relates to Exploration Results is based on information compiled by Mr Derek Waterfield, a Member of the Australian Institute of Geoscientists and a full time employee of Legend Mining Limited. Mr Waterfield has sufficient relevant experience in the styles of mineralisation and types of deposit under consideration, and in the activity he is undertaking, to qualify as a Competent Person as defined in the 2004 Edition of the "Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (the JORC Code), and consents to the inclusion of the information in the form and context in which it appears.

Exploration Target

While the company remains optimistic it will report resources and reserves in the future at its Gum Creek Project, any discussion in relation to exploration targets, resource potential, reserves or 'ore' is only conceptual in nature, there has been insufficient exploration to define a Mineral Resource at the company's Gum Creek Project and it is uncertain if further exploration will result in the determination of a Mineral Resource.

Table 1: Forward Modelling Tonnage Estimate

											TOTAL	2,486

Table Parameters:

- X, Y, Z East, north and RL coordinates for the top of model.
 Strike Strike direction of the model.
 SI Modelled magnetic susceptibility $\times 10^{-3}$.
 Strike Length Interpolated strike length between models.
 Dip Dip of the model.
 True Width True thickness of the model.
 Depth Down dip depth extent of the model.
 Volume Volume of model.
 Tonnage Tonnage calculated from strike, thickness, depth and assumed 3.3g/cm³ density.
