## WARREN WEDGES CONTINUE TO IMPRESS

4 APRIL 2022

### KEY POINTS

- Latest Warren results confirm channel prospectivity
- **9.05m @ 2.82% Ni** in WRN21DD\_003W1
- Down plunge wedge assays also record significant nickel results
- **4.8m @ 3.09% Ni** in WRN21DD\_001W7
- Results are an important step in growing Mineral Resources at Warren
- Update on N75C maiden Mineral Resource progress

Lunnon Metals Limited (**ASX: LM8**) (the **Company** or **Lunnon Metals**) is pleased to provide an update on the progress of its discovery programme in the Warren channel, part of the previously operated Foster nickel mine at its Kambalda Nickel Project (**KNP**).

Diamond hole WRN21DD\_003W1, reported on 7 March 2022 as intersecting an 8.5m zone (from 343.45m) of variably disseminated, matrix and massive nickel sulphide mineralisation, has now returned the following significant intersection (above a 1.0% Ni cut off):

- **9.05m @ 2.82% Ni** from 343.45m including:
  - **3.8m @ 4.84% Ni** from 348.45m (Ni sulphide mineralisation at basalt contact)

Further down plunge, wedge holes W2, W3 and W7 from parent WRN21DD\_001 have also been returned recording (above a 1.0% Ni cut off):

- **W7:**
  - **4.8m @ 3.09% Ni** from 498.6m
- **W3:**
  - **3.05m @ 1.51% Ni** from 501.75m; and
  - **0.95m @ 1.96% Ni** from 541.45m
- **W2:**
  - **1.6m @ 1.18% Ni** from 507.5m

True widths are estimated to be approximately 75% of the reported drill widths.

Managing Director, Ed Ainscough, commenting said:

*"Two significant areas that had been "gaps" in the WMC drill coverage are now being filled and continue to yield impressive widths and grades of nickel mineralisation; that's 400m of down plunge extent below the very limited historical mining where we continue to add nickel mineralisation. The opportunity now is to extend this programme further down plunge to the other side of WMC's Jardiniere Trough structure and keep expanding the area that may host nickel sulphides in the deepest known parts of the Warren channel".*

## DISCOVERY RATIONALE

Lunnon Metals' programme at Warren is designed to demonstrate that this channel, a separate nickel mineralised channel in its own right, has the potential to host substantially more than the current figure of 6,400t<sup>1</sup> of nickel metal. The adjacent Foster channel, 1.5km to the immediate south-east, has an endowment of close to 94,000t of nickel at 2.92% Ni (>61,000t mined previously up to 1994 and 32,600t in the Company's current JORC Mineral Resource).

To achieve this goal the Company's simple objective at Warren is to target the prospective nickel contact between the very broad drill spacing left by WMC Resources Ltd (WMC) when the mine closed in 1994. Most importantly, these current results demonstrate the need to keep an open mind with respect to potential flanking mineralisation immediately above and below the previously identified channels, as now recorded in WRN21DD\_001W7.

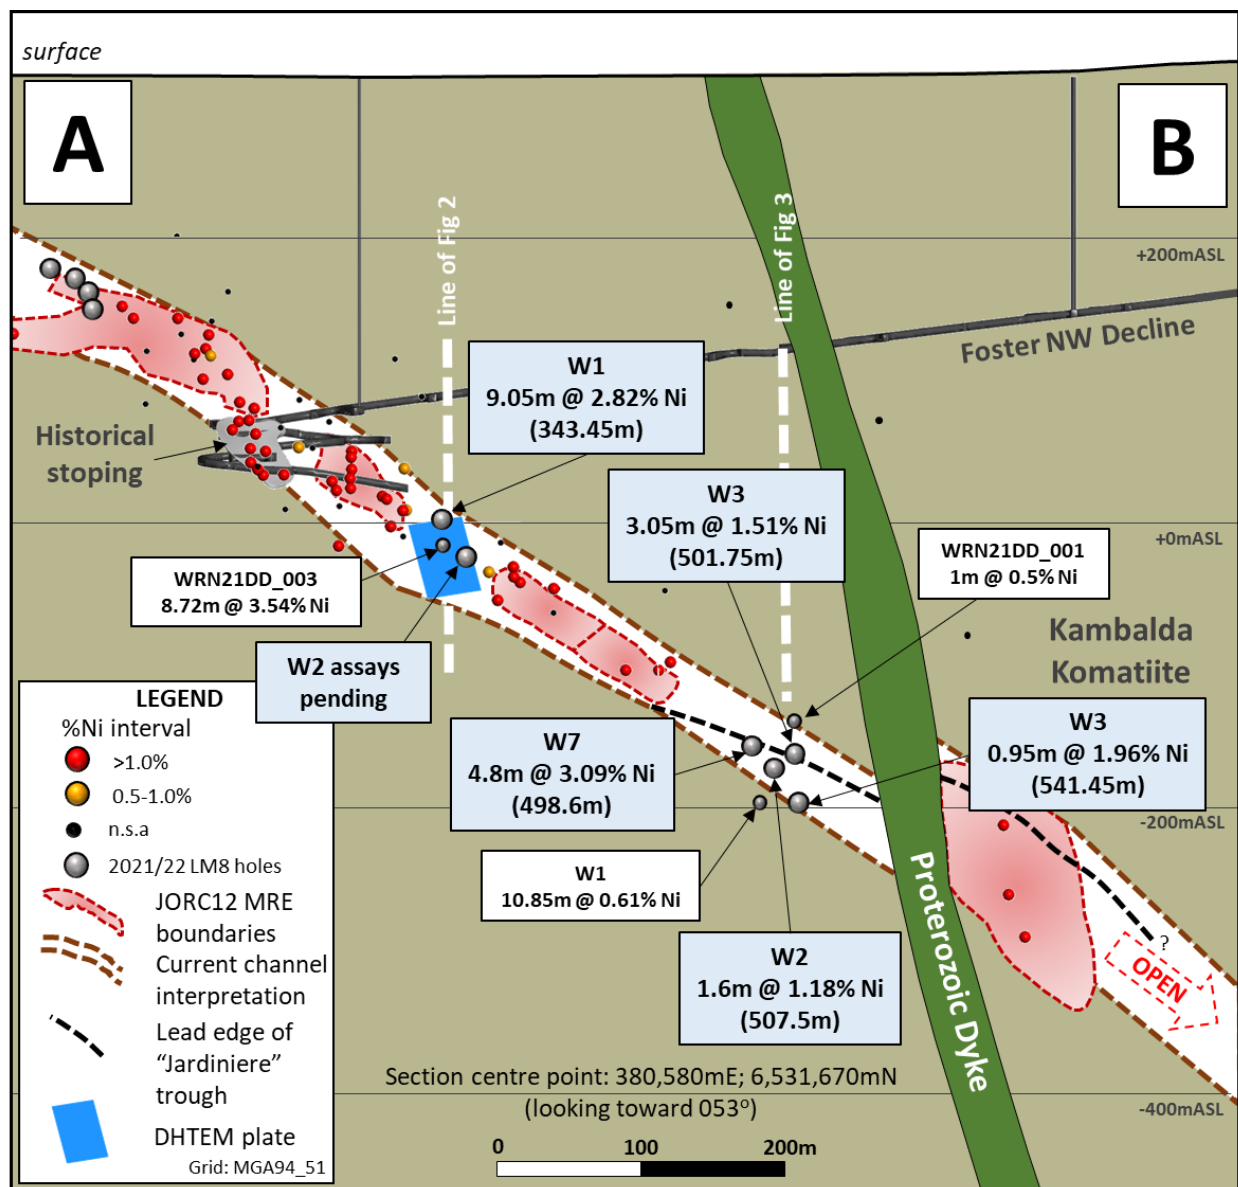

Figure 1: Long Projection of the Warren channel showing pierce points for WMC intercepts and the WRN21DD\_003 parent and wedge programme together with wedges W2, W3 and W7 from WRN21DD\_001 (new result call-outs shaded blue – see Figure 6 for approximate location of long projection in plan).

<sup>1</sup> Full details of the Mineral Resource reported at Warren are included in the Prospectus and associated ITAR lodged on the ASX on 11 June 2021

## CROSS SECTION CONTEXT

A cross section for WRN21DD\_003 parent and the completed and assayed wedge hole W1 is shown below.

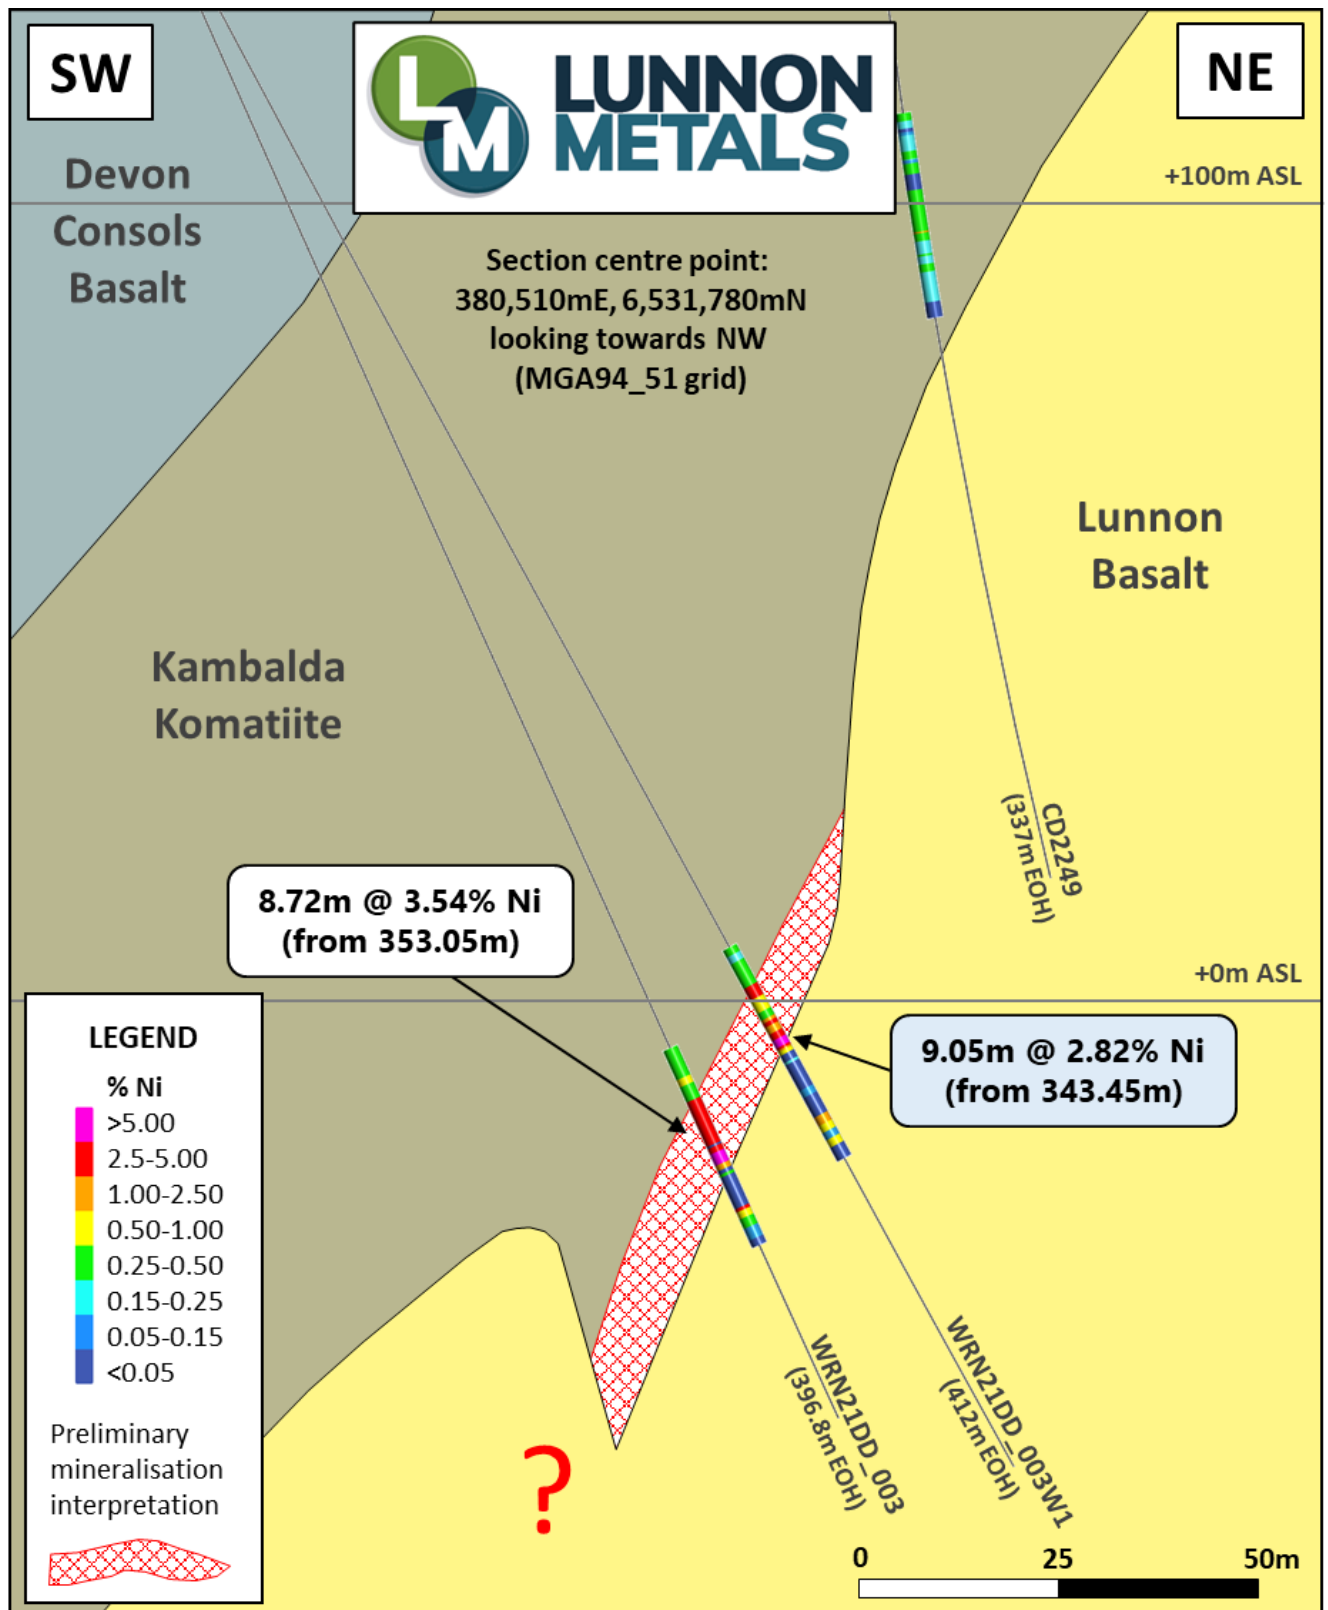

Figure 2: Cross section through WRN21DD\_003 parent and the completed and assayed wedge hole W1 (new result call-out shaded blue).

Some 300m down plunge from the WRN21DD\_003 programme, W7 was the fourth wedge hole completed from parent hole WRN21DD\_001. This wedge W7 is targeting the Warren channel in an area where it is believed a concealed, prospective nickel contact may be present. A similar nickel contact setting is seen on the immediate south side of a later Proterozoic dyke, termed the *Jardiniere Trough* (see description reported on 15 February 2022), a further 160m down plunge. This wedge W7 complemented wedges W2 and W3 and successfully intersected nickel sulphides on the sediment covered outer flank contact (see Figure 1 for pierce point). The cross section below has been updated with the assay results for all completed wedges now annotated.

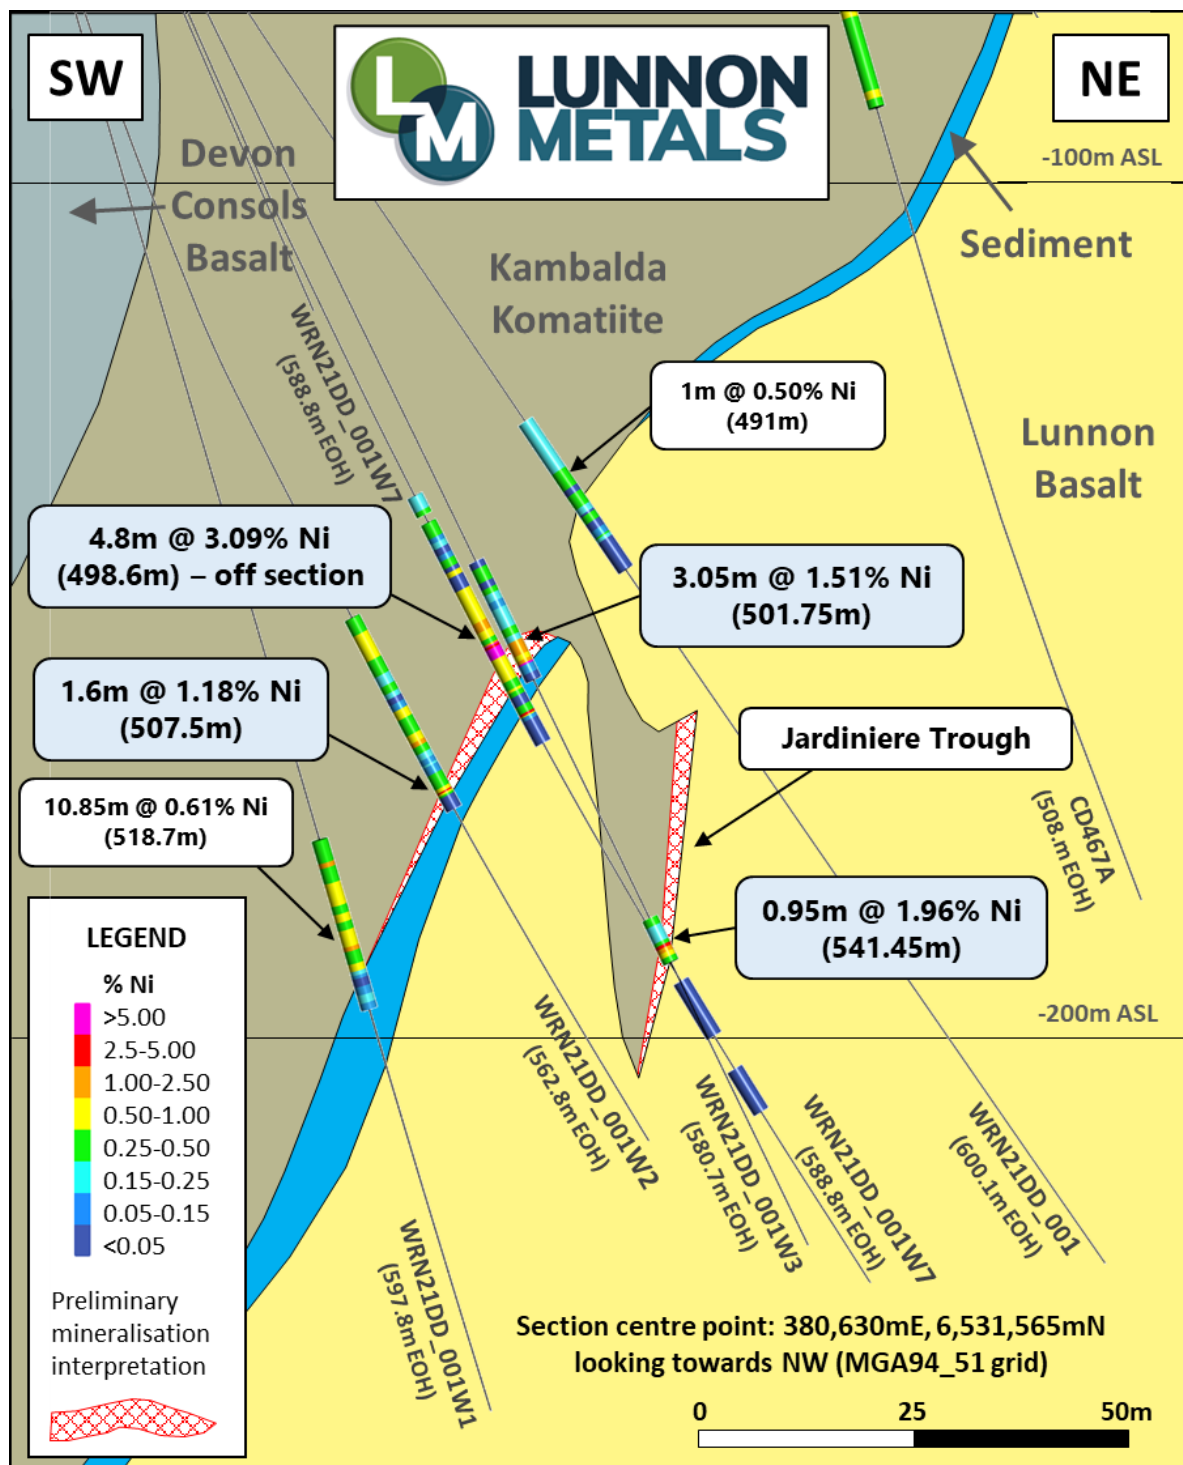

Figure 3 Cross section through WRN21DD\_001 parent and associated wedged holes W2, W3 and W7 (new result call-outs shaded blue; W7 is approximately 20m off section).

## WARREN WEDGE DRILLING UPDATE

As previously reported, the Down Hole Transient Electro-Magnetic (DHTEM) surveying of WRN21DD\_003 recorded a high conductance, late time response modelled as a 55m x 40m plate. This plate was coincident with the presence of nickel sulphide mineralisation on the prospective komatiite-basalt contact in that hole (8.72m @ 3.54% Ni reported 4 January 2022) and the first wedge (W1), reported today.

A second wedge hole (W2) off parent hole WRN21DD\_003, has hit nickel sulphides approximately 20m to the south and slightly down plunge from the parent hole. Once more this intercept was exactly at the downhole depth predicted by the DHTEM plate (see Figure 1 for approximate pierce point). Two further surface diamond holes yet to be commenced will target the northern and down dip edges of the 55m x 40m plate.

### Geological logging summary (WRN21DD\_003W2)

The diamond hole has been logged as having a 0.55m wide nickel sulphide zone on the Kambalda Komatiite - Lunnon Basalt contact, with further remobilised massive nickel sulphides present in the footwall of this contact indicative of a pinch-out position on a nearby minor or secondary trough. This is a narrower intercept than the mineralisation intersected in the parent and the first wedge hole reported above suggesting a location on the edge of the conductive DHTEM plate. Field analysis of these zones by XRF unit confirmed the presence of nickel.

The geological description for the wedge hole W2 is as follows:

**Table 1: WRN21DD\_003W2**

Down hole depth (m)	Interval (m)	Host	Visual estimates	
			Sulphide % in rock	Mineralisation description
358.65	0.95	Talc magnesite ultramafic (Kambalda Komatiite)	5-30%	Disseminated blebby and weak matrix style pyrrhotite and minor pentlandite, pyrite and trace chalcopyrite
359.60	7.65		~5%	Disseminated with occasional blebs of pyrrhotite and minor pentlandite, pyrite and chalcopyrite in foliated ultramafic host
367.25	0.15		10-40%	Matrix style pyrrhotite as blebs/network, with minor pentlandite, pyrite and chalcopyrite
367.40	0.40		>80%	Massive >90% sulphides; pyrrhotite and pyrite dominant with pentlandite and chalcopyrite
375.10	0.15	Lunnon Basalt	>80%	A further 6.5m below contact, massive pyrrhotite / pentlandite pyrite remobilised into footwall basalt

*Note: in relation to the reporting of visual mineralisation, the Company highlights that visual estimates of sulphide abundance, even when confirmed by XRF analysis in the field, cannot be considered a substitute for laboratory analysis. Assay results are required to determine the exact widths and grades of the nickel sulphide mineralisation identified. When these results are available, the Company will provide an update to the market.*

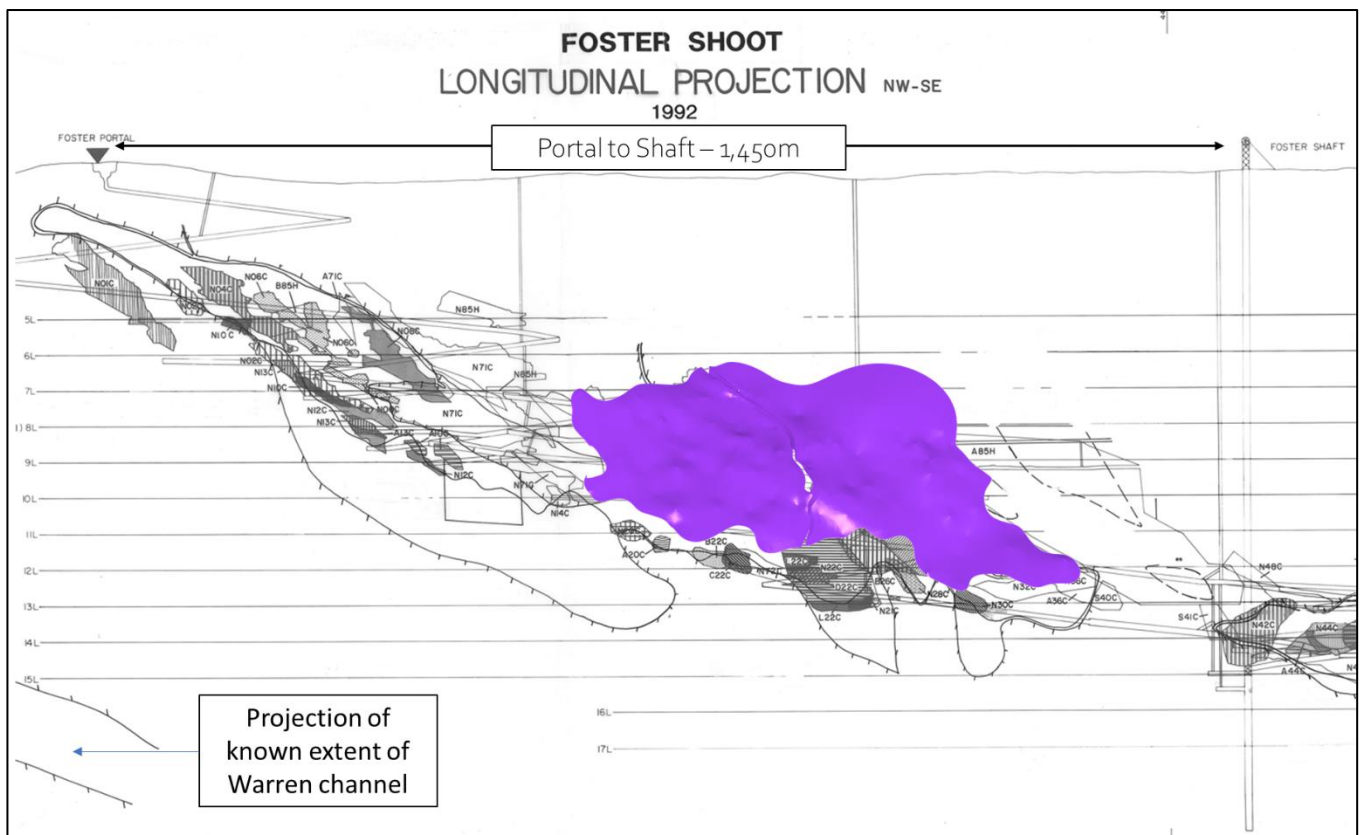

## N75C MINERAL RESOURCE UPDATE

At the adjacent Foster mine area, geological interpretation, modelling and grade estimation of the N75C is now complete with the final step prior to release being resource categorisation, depletion by past mining and JORC 2012 compliance reporting. Due to the significant amount of re-logging, cutting and re-assaying of historical WMC diamond core that had previously been completed by Lunnon Metals staff as part of the Company's Historical Core Programme, it has been possible to model and estimate nickel mineralisation for an area much larger than previously forecast (see Figures 4 and 5 below).

Consequently, the Mineral Resource being prepared will include maiden Mineral Resources for the N75C, 18C and 24C. These nickel shoot names reflect terminology applied by WMC in connection with the presence of porphyry (N75C) and sediment (18 and 24C) on the prospective Kambalda Komatiite – Lunnon Basalt contact.

The presence of nickel mineralisation remaining in these geological positions coupled with the observation by Company geologists that this central to southern, up dip flank of the main Foster nickel channel is not closed off by previous WMC drilling, opens up a potentially significant new search space at the Foster mine, in particular further down plunge to the south.

The final Mineral Resource report will be available and reported shortly with technical summary details and full JORC 2012 Table 1, Sections 1, 2 and 3 documentation.

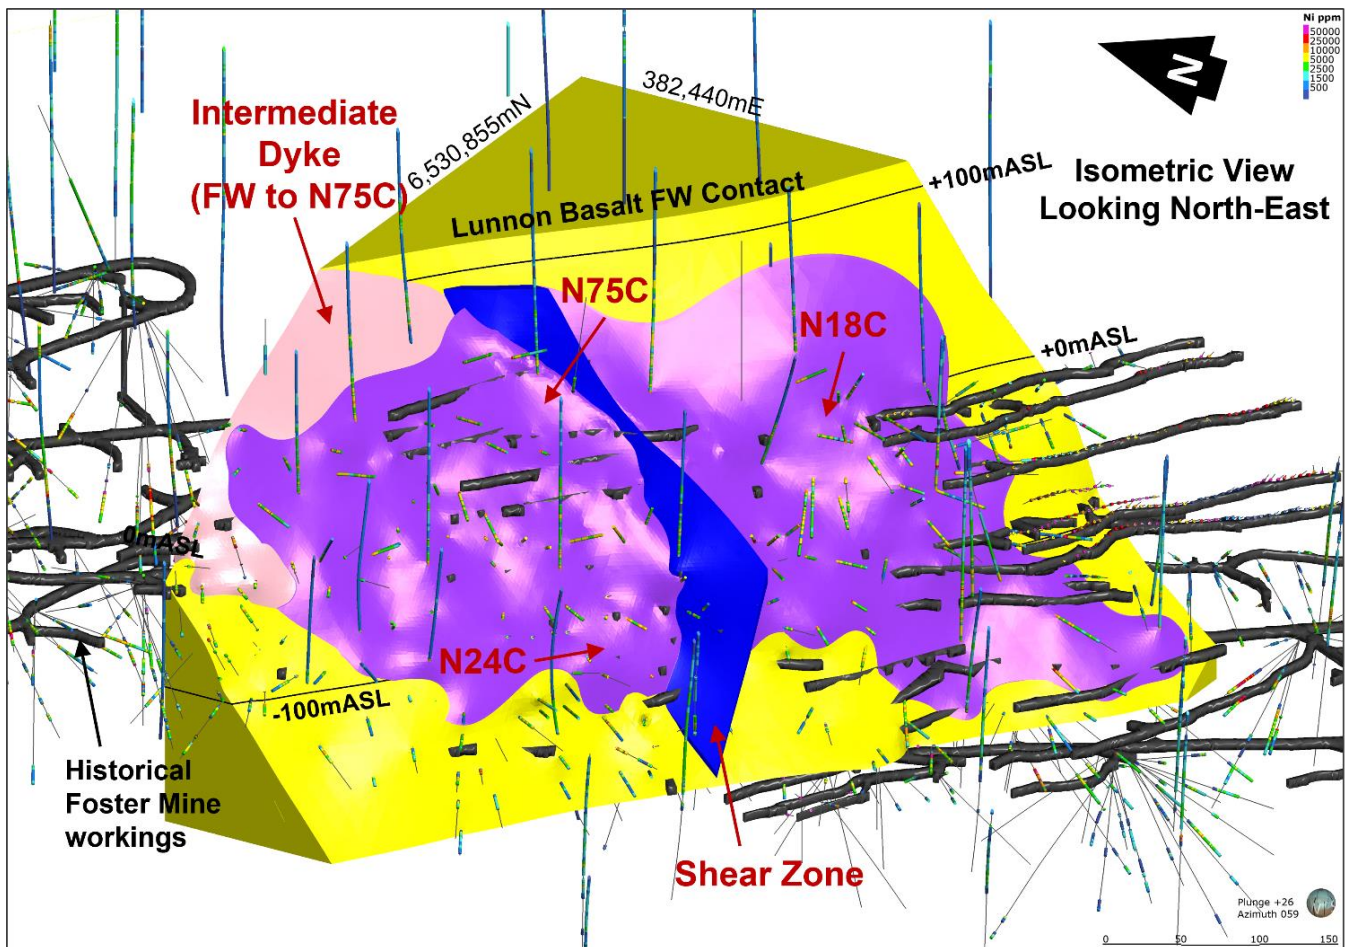

Figure 5: Isometric view of the N75C, 18C and 24C nickel surfaces at the Foster Mine, KNP illustrating key lithology, structure and position relative to the existing workings.

This announcement has been approved for release by the Board of Lunnon Metals Ltd.

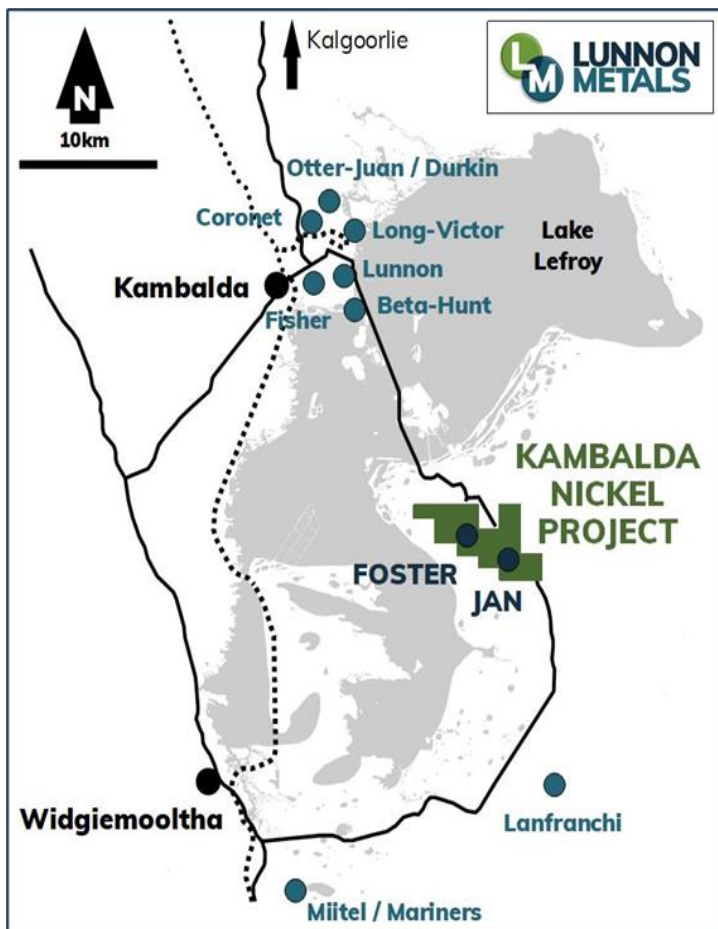

Figure 7: Regional Location of the Kambalda Nickel Project and other nearby nickel deposits

## ABOUT THE KAMBALDA NICKEL PROJECT ("KNP")

Lunnon Metals holds 100% of the mineral rights at KNP, subject to certain rights retained by St Ives\*. Full details of the Company's IPO and the transactions involved are in the Prospectus submitted to the ASX dated 22 April 2021 and lodged with the ASX on 11 June 2021.

KNP, shown in its regional location in Figure 7, is approximately 23km<sup>2</sup> in size comprising 19 contiguous granted mining leases situated within the Kambalda Nickel District which extends for more than 70 kilometres south from the township of Kambalda ("Tenements").

This world-renowned nickel district has produced in excess of 1.4 million tonnes of nickel metal since its discovery in 1966 by WMC Resources Ltd ("WMC"). In addition, close to 15Moz of gold in total has been mined with WMC accounting for 5.9Moz and over 8.3Moz produced by Gold Fields Ltd since the purchase of the operation in December 2001 from WMC, making the Kambalda/St Ives district a globally significant gold camp in its own right.

\*St Ives retains rights to explore for and mine gold in the "Excluded Areas" on the Tenements as defined in the subsisting agreements between Lunnon Metals and St Ives. This right extends to gold mineralisation which extends from the Excluded Area to other parts of the Tenements with select restrictions which serve to prevent interference with, or intrusion on, Lunnon Metals' existing or planned activities and those parts of the Tenements containing the historical nickel mines. St Ives has select rights to gold in the remaining areas of the Tenements in certain limited circumstances as described in detail in the Company's Solicitor Report attached to the Prospectus submitted to the ASX dated 22 April 2021 and lodged with the ASX on 11 June 2021.

## COMPETENT PERSON'S STATEMENT & COMPLIANCE

Any information in this announcement that relates to geology, nickel Mineral Resources and Exploration Results, is based on, and fairly represents, information and supporting documentation prepared by Mr. Aaron Wehrle, who is a Member of the Australasian Institute of Mining and Metallurgy (AusIMM). Mr. Wehrle is a full time employee of Lunnon Metals Ltd, a shareholder and holder of employee options; he has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that he is undertaking to qualify as Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr. Wehrle consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

## MINERAL RESOURCES

The detailed breakdown of the Company's Mineral Resources is as follows:

Foster Mine		Indicated			Inferred			Total		
Shoot	Cut-off (Ni %)	Tonnes	% Ni	Ni metal	Tonnes	% Ni	Ni metal	Tonnes	% Ni	Ni metal
85H	1%	387,000	3.3	12,800	300,000	1.3	3,800	687,000	2.4	16,600
Foster South	1%	223,000	4.7	10,500	116,000	4.8	5,500	340,000	4.7	16,000
Warren	1%	136,000	2.7	3,700	75,000	3.7	2,700	211,000	3.1	6,400
Total		746,000	3.6	27,000	491,000	2.4	12,000	1,238,000	3.2	39,000

Note: Inconsistencies in totals due to rounding

## DISCLAIMER

References in this announcement may have been made to certain previous ASX announcements, which in turn may have included exploration results and Mineral Resources. For full details, please refer to the said announcement on the said date. The Company is not aware of any new information or data that materially affects this information. Other than as specified in this announcement and mentioned announcements, the Company confirms it is not aware of any new information or data that materially affects the information included in the original market announcement(s), and in the case of estimates of Mineral Resources that all material assumptions and technical parameters underpinning the estimates in the relevant announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original announcement.

## JORC TABLE 1

### SECTION 1 SAMPLING TECHNIQUES AND DATA

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<i>Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down-hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i>	<ul style="list-style-type: none"> <li>Reverse Circulation (RC) and Diamond Drill holes (DDH) at the Kambalda Nickel Project (KNP) were completed by Blue Spec Drilling Pty Ltd (Blue Spec) on behalf of Lunnon Metals following protocols and QAQC procedures aligned with industry best practice as follows.</li> </ul> <p><u>DDH</u></p> <ul style="list-style-type: none"> <li>Core samples were collected with a diamond rig drilling HQ3 (61mm) from surface within weathered and saprolite material before casing off within hard rock and completing the hole with NQ2 (51mm) diameter core.</li> <li>All DDH have been reconstructed and orientated over zones of interest, logged geologically, and marked up for assay at a typical minimum sample interval of 0.3m to ensure adequate sample weight and a typical maximum sample interval of 1.0m, constrained by geological boundaries.</li> <li>After logging and photographing, selected sample intervals of drill core were cut in half with a diamond saw, with one half sent to the laboratory for assay and the other half retained.</li> <li>Sample weights vary depending on sample width and density of the rock.</li> <li>All DDH core is stored in industry standard core trays labelled with the drill hole ID and core intervals.</li> <li>Industry prepared independent standards and blanks are each inserted, approximately every 50 samples.</li> <li>The independent laboratory then takes the samples which are dried, crushed and pulverized prior to analysis as described below.</li> <li>For sample weights &gt; 3kg the sample is dried, crushed to 2mm, split and pulverised up to 3kg (with the coarse reject retained).</li> <li>Sample sizes are considered appropriate for the material sampled.</li> <li>The samples are considered representative and appropriate for this type of drilling.</li> <li>DDH core samples are appropriate for use in a resource estimate.</li> </ul> <p><u>pXRF</u></p> <ul style="list-style-type: none"> <li>Where a handheld XRF tool was used, it was done so to verify the presence of nickel mineralisation above a 0.5% Ni cut off. The XRF results themselves are not reported and used as a logging/sampling verification tool only.</li> <li>Determination of materiality has been based on geological logging, visual inspection the use of the pXRF unit.</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>Sampling procedures followed by Western Mining Corporation Ltd (WMC) in the drilling, retrieval, and storage of diamond drill core both surface and underground are considered to be in line with industry standards at the time (1966 to 2001).</li> <li>The drill core was typically collected in steel core trays of 1.0m lengths comprising five to seven compartments depending on drill core diameter. The core trays were numbered with the downhole meterage for the start of the first 1 m run and the end of the last 1 m run on the lip of the core tray and typically included core blocks within the core trays demarcating the depth meterage of rod pull</li> </ul>
	<i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>	
	<i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i>	

Criteria	JORC Code explanation	Commentary
		<p>breaks.</p> <ul style="list-style-type: none"> <li>The drillhole number and the 'from' and 'to' depth of the contained drill core was labelled on the front of the core tray. The earlier drilling was collected in wooden, and hybrid wooden/steel core trays and occasionally depths recorded in feet.</li> </ul> <p><u>DHTEM</u></p> <ul style="list-style-type: none"> <li>DHTEM surveys were conducted using the DigiAtlantis system and DRTX transmitter. The readings were recorded at 2.5m to 10m intervals. The survey used loops ranging from 300m x 200m to 690m x 290m in orientations designed relative to the target and stratigraphic setting.</li> </ul>
<b>Drilling techniques</b>	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</i>	<ul style="list-style-type: none"> <li>DDH were drilled from surface using HQ3 (61mm) diameter in weathered, broken ground before casing off and drilling NQ2 (51mm) to end of hole.</li> <li>Some DDH utilised historical or new RC pre-collars of typical depths of 100m to 150m.</li> <li>Although no documentation is available to describe the drilling techniques used by WMC at the time it is understood that the various drilling types used conventional drilling methods consistent with industry standards. None of the diamond drill core was oriented.</li> </ul>
<b>Drill sample recovery</b>	<p><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></p> <p><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></p> <p><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></p>	<ul style="list-style-type: none"> <li>DDH core recovery is measured for each drilling run by the driller and then checked by the Company's geological team during the mark up and logging process.</li> <li>No sample bias is observed.</li> <li>There is no relationship between recovery and grade nor bias related to fine or coarse sample material.</li> <li>There are no available records for sample recovery for diamond drilling completed by WMC; however, re-logging exercises completed by Lunnon Metals of both underground and surface diamond drillholes from across the KNP between 2017 and 2021 found that on average drill recovery was very good and acceptable by industry standards.</li> </ul>
<b>Logging</b>	<p><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></p> <p><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</i></p> <p><i>The total length and percentage of the relevant intersections logged.</i></p>	<p><u>For DDH:</u></p> <ul style="list-style-type: none"> <li>Geology logging is undertaken for the entire hole recording lithology, oxidation state, mineralisation, alteration, and veining.</li> <li>DDH structural logging, recovery of core, hardness, and Rock Quality Designation (RQD's) are all recorded from drill core over intervals of interest.</li> <li>Geological logging (and where required, geotechnical logging) is completed in sufficient detail to support future Mineral Resource estimation, mining and metallurgical studies to be undertaken with confidence.</li> <li>Additional metallurgical testwork will be completed if warranted in the future in addition to the geological logging and element assaying detailed below.</li> <li>General logging data captured are qualitative (descriptions of the various geological features and units) and quantitative (numbers representing structural attitudes, vein and sulphide percentages, magnetic susceptibility and conductivity).</li> <li>DDH core is photographed in both dry and wet form.</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>There is no available documentation describing the logging procedures employed by WMC geologists at the Foster nickel mine</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>or in the KNP area generally; however, the historical graphical hardcopy logs and other geoscientific records available for the project are of high quality and contain significant detail with logging intervals down to as narrow as 0.01 m. The geological logs document lithology, textures, structures, alteration, and mineralisation observed in drill core captured both graphically and in a five-character logging code (Lunnon Metals notes that a previous logging legend employed at WMC's Kambalda nickel operations utilised a 3 letter code which is often represented on hard copy plan and cross sections of an older vintage and which was converted by WMC to the latter 5 character code at some later time). Stratigraphy is also captured in a three-character logging code. Sample intervals are recorded on the graphical log. These logging legends are well documented in lieu of a recorded procedure.</p> <ul style="list-style-type: none"> <li>• In regard geotechnical logging or procedures, there is no record of any formal relevant procedures or logging and based on personal experience of the Competent Person, such logging was not routinely completed prior to the introduction of Regulation 10:28 in the WA Mine Safety and Inspection Act, requiring the same in approximately 1996.</li> <li>• Based on the personal experience of the Competent Person(s) to this announcement, having worked for WMC in Kambalda between 1987 and 2001, it is known that WMC had a rigorous and regimented system for storing and archiving the graphical logs physically, microfilmed, and drafted on to master cross sections, plans, and long sections as well as capturing the interval data (logging and assays) digitally in database format.</li> <li>• Lunnon Metals sourced historical diamond core from the St Ives Kambalda core yard on Durkin Road where relevant to its investigations. A selection of high priority drillholes was typically identified based on proximity to the proposed area of interest. Thereafter a representative number of holes were re-logged to validate lithological and structural information whilst a lesser number of holes were logged for geotechnical data such as rock RQD, fracture count assessment and core recovery.</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	<p><u>DDH</u></p> <ul style="list-style-type: none"> <li>• DDH core samples were collected with a diamond drill rig drilling NQ2 or HQ3 core. After logging and photographing, diamond core was cut within a Discoverer® Automatic Core Cutting Facility using a Corewise Auto Core Saw.</li> <li>• DDH core was cut in half, with one half sent to the laboratory for assay and the other half retained.</li> <li>• Holes were sampled over mineralised intervals to geological boundaries on a nominal 1.0m basis with a typical minimum of 0.3m and a typical maximum of 1.0m.</li> <li>• Field QAQC procedures involve the use of certified reference material (CRM) and blank material, each inserted approximately 1 in every 50 samples.</li> <li>• Field duplicates were collected at a rate of 1 in 25 samples by cutting the core into quarters and submitting both quarters to the laboratory for analysis.</li> </ul> <p><u>DDH</u></p> <ul style="list-style-type: none"> <li>• At the assay laboratory, each sample was dried, split (if sample</li> </ul>
	<i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i>	
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	
	<i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i>	

Criteria	JORC Code explanation	Commentary
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	<p>weight was &gt;3kg), crushed, and pulverised.</p> <ul style="list-style-type: none"> <li>Sample sizes are considered appropriate for the style of mineralisation (potentially nickeliferous massive, matrix and disseminated sulphides, hosted in komatiite and basalt; and altered quartz veins/shear structures considered potentially auriferous in all lithological types).</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>All historical core that was relevant to the mineralisation drilled and sampled by WMC as sighted by Lunnon Metals was sawn with half or quarter core sampling practices. It is assumed that all samples reported or otherwise contributing to any estimation of nickel mineralisation by Lunnon Metals were processed with this standard methodology.</li> <li>Portions of drill core distal to the main high-grade mineralisation were sometimes 'chip sampled' by WMC. Lunnon Metals has chosen not to utilise such samples in any estimation of grade or mineralisation.</li> <li>WMC typically sampled in interval lengths relevant to the underlying lithology and mineralisation such that sample interval lengths may vary from between minima of 0.05 m and maxima up to 2.00 m within any mineralised zone, shoot or nickel surface of interest. Intervals of no mineralisation or interest were not sampled. Review of historical drill core during re-logging and re-sampling exercises by Lunnon Metals indicated that there were no areas of interest relevant to nickel mineralisation that were not half or quarter core sawn and sampled by WMC and that the sample sizes were appropriate for the type, style and thickness of mineralisation being tested with sample breaks corresponding to lithological or mineralisation breaks being the norm. Although faded through time, sample depth intervals are evident as marked on the remaining half core as observed by Lunnon Metals and these correlate to sample interval depths in the original paper graphical drill logs and the database.</li> <li>While the WMC procedure for logging, sampling, assaying and QAQC of drillhole programs was not available at the time of this announcement it is interpreted that it was of high quality and in line with industry standards at that time.</li> <li>It is the opinion of the Competent Person(s) that the sample preparation, security, and analytical procedures pertaining to the above-mentioned historical WMC drilling are adequate and fit for purpose based on: <ul style="list-style-type: none"> <li>WMC's reputation of excellence in geoscience stemming from their discovery of nickel sulphides in Kambalda in the late 1960s;</li> <li>identification of procedures entitled "WMC QAQC Practices for Sampling and Analysis, Version 2 - adapted for St Ives Gold" dated February 2001 and which includes practices for nickel; and</li> <li>the first-hand knowledge and experience of the Competent Person(s) of this announcement whilst working for WMC at Kambalda between 1987 and 2001.</li> </ul> </li> </ul>
	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and</i>	<ul style="list-style-type: none"> <li>Samples were submitted to Intertek Genalysis in Kalgoorlie for sample preparation i.e. drying and pulverising.</li> <li>Pulverised samples were then transported to Intertek Genalysis in</li> </ul>

<b>Quality of assay data and laboratory tests</b>	<i>whether the technique is considered partial or total.</i>	Perth for analysis.
	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i>	<ul style="list-style-type: none"> <li>Samples were analysed for a multi-element suite including Ni, Cu, Co, Ag, Cu, As, Co, Fe, Mn, Pb, S, Zn. Analytical techniques used a four-acid digest (with ICPMS finish) of hydrofluoric, nitric, perchloric and hydrochloric acids, suitable for near total dissolution of almost all mineral species including silica-based samples.</li> <li>Where considered necessary, Au was analysed using 50g lead collection fire assay and analysed by ICPOES.</li> <li>These techniques are considered quantitative in nature.</li> <li>As discussed previously, CRM is inserted by the Company and the laboratory also carries out internal standards in individual batches.</li> <li>The resultant Lunnon Metals and laboratory QAQC data is reviewed upon receipt to determine that the accuracy and precision of the data has been identified as acceptable.</li> <li>Where handheld pXRF results are referenced, the tool was used to verify the presence of nickel mineralisation in the zones disclosed, above a 0.5% Ni notional threshold. The unit is a Bruker, S1 Titan 900 model.</li> </ul>
	<i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i>	<p><u>DHTEM</u></p> <ul style="list-style-type: none"> <li>DHTEM parameters were as follows</li> <li>Tx Loop Size range from 300m x 200m up to 690m x 290m</li> <li>Transmitter: DRTX</li> <li>Receiver: DigiAtlantis</li> <li>Probe: DigiAtlantis</li> <li>Station Spacing: 2.5m to 10m</li> <li>Tx Current range from 50A to 75A</li> <li>Base Frequency: 1Hz</li> <li>Readings: Min 3 repeatable readings per station</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>There is no data available at the time of this announcement pertaining to the assaying and laboratory procedures nor the historical field or laboratory quality assurance and quality control (QAQC), if any, undertaken by WMC drilling programs at the Foster nickel mine or in the KNP area generally; however, it is expected that industry standards as a minimum were likely to have been adopted at the Foster mine, KNP area and the analytical laboratory, considering WMC's reputation for excellence in geosciences.</li> <li>The extensive Lunnon Metals re-sampling programme of historical ½ or ¼ core drill core applied the methodology and practices as recorded above for current RC &amp; DDH.</li> </ul>
	<i>The verification of significant intersections by either independent or alternative company personnel.</i>	<ul style="list-style-type: none"> <li>Significant intersections have not been independently verified and no twinned holes have been completed.</li> <li>Logging and sample intervals are uploaded by Company geologists once logging is completed into internal cloud hosted datasheets and then to a database managed by Maxwell Geoservices Pty Ltd (maxgeo).</li> <li>Assays from the laboratory are checked and verified by maxgeo database administrator before uploading.</li> <li>No adjustments have been made to assay data.</li> <li>Any assays results for a composited interval within a drillhole are reported on a length weighted basis.</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>Diamond core data - Lunnon Metals has undertaken exhaustive</li> </ul>
	<i>The use of twinned holes.</i>	
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	
	<i>Discuss any adjustment to assay data.</i>	

Criteria	JORC Code explanation	Commentary
		<p>analysis of historical WMC underground and surface diamond drilling to inspect and visually validate significant drill assays and intercepts that inform any interpretation of nickel mineralisation including any MRE work.</p> <ul style="list-style-type: none"> <li>Firstly, confirmation is made of the sample ID and visual presentation of the core (to match logged lithology). Then the re-sampling exercise of remaining ½ or ¼ core drill core represents an independent duplicate style of data verification of the original nickel assay results obtained by WMC as stored in the database. The analysis of the duplicate samples is undertaken through Intertek's laboratory in Perth using four-acid digest with ICP-OES or ICP-MS finish with appropriate company and laboratory analytical QAQC procedures.</li> <li>No significant anomalies have been identified and the Competent Person is satisfied that the original data is representative of the geology and mineralisation modelled; thus no adjustments to assay data have been deemed necessary or made.</li> <li>No twin holes have been completed to date. No non company personnel (other than in the assay laboratory processes) or alternative company personnel have been involved in the exercise due to the small size of the company and the robustness of the procedures detailed herein.</li> <li>Lunnon Metals notes that the Kambalda style of nickel mineralisation is highly visible permitting the nickel grade to be relatively accurately estimated by experienced geologists; this is a practise that is not uncommon in the nickel mining industry.</li> </ul>
<b>Location of data points</b>	<i>Accuracy and quality of surveys used to locate drillholes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	<ul style="list-style-type: none"> <li>DDH hole collar locations are located by handheld GPS to an accuracy of +/- 3m.</li> <li>All drill holes were surveyed downhole at 5m intervals using the REFLEX gyro spirit-IQ system (north seeking gyro) for both azimuth and dip measurements.</li> <li>Downhole surveys are uploaded to the IMDEXHUB-IQ, a cloud-based data management program where surveys are validated and approved by the geologist before importing into the database.</li> <li>The grid projection is GDA94/ MGA Zone 51.</li> <li>Diagrams and location data tables are provided in the report where relevant.</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>Historical methods of drill collar survey pick-up are not known. The easting, northing and elevation values were originally recorded in local KNO ("Kambalda Nickel Operations") grid and later converted to the currently used GDA94/MGA Zone 51 grid. Both the original KNO grid coordinates and the converted coordinates are recorded in the database. A representative number of historical drill collars were located in the field and their locations cross checked via differential GPS and/or handheld GPS to validate the database collar coordinates.</li> <li>Historical hardcopy downhole survey data is generally available for all surface drillholes and the records show that single shot magnetic instruments were used. A representative number of these hardcopy downhole survey records have been cross checked against the digital records in the database.</li> <li>No new downhole surveys have been conducted however Lunnon Metals has corrected where necessary incorrect data in the database where down hole measurements from the hardcopy data were</li> </ul>
	<i>Specification of the grid system used.</i>	
	<i>Quality and adequacy of topographic control.</i>	

Criteria	JORC Code explanation	Commentary
		<p>incorrectly processed.</p> <ul style="list-style-type: none"> <li>No other significant errors or inconsistencies were deemed present or capable of being detrimental to any interpretation of nickel mineralisation including any MRE work.</li> </ul>
<b>Data spacing and distribution</b>	<i>Data spacing for reporting of Exploration Results.</i>	<ul style="list-style-type: none"> <li>The RC and DDH programme at KNP comprises drillhole spacings that are dependent on the target style, orientation and depth. Drillholes are not drilled to set patterns or spacing at the exploration stage of the programme.</li> <li>If follow up drilling is warranted with the objective of progressing the prospect towards a data density sufficient to support a future Mineral Resource estimation, spacing may vary from 40m x 40m to 40m x 20m, again subject to the target style dimensions, orientation and depth.</li> <li>All holes have been geologically logged and provide a strong basis for geological control and continuity of mineralisation.</li> <li>No Mineral Resource or Ore Reserve estimations are presented for the area the subject of the exploration results.</li> <li>No sample compositing has been applied except in the reporting of drill intercepts within a single hole, as described in this table.</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>The typical drill spacing for the early WMC drill traverses is approximately 120m apart with drillhole spacing along the traverses between 10m and 80m (close spacing where present was due to between one and four wedge holes from each parent hole). These traverses were sometimes infilled to about 60m spacing where drillhole depths were less than approximately 450m.</li> </ul>
	<i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied</i>	
	<i>Whether sample compositing has been applied.</i>	
<b>Orientation of data in relation to geological structure</b>	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	<ul style="list-style-type: none"> <li>The preferred orientation of drilling at KNP is designed to intercept the target approximately perpendicular to the strike and dip of the mineralisation where/if known. Subsequent sampling is therefore considered representative of the mineralised zones if/when intersected.</li> <li>At Warren the majority of historical drill holes were collared vertically and lifted/drifted in towards close to perpendicular with depth as the nickel contact was approached.</li> <li>The chance of bias introduced by sample orientation relative to structures, mineralised zones or shears at a low angle to the drillhole is possible, however quantified orientation of the intercepted interval allows this possible bias to be assessed. Where drilling intercepts the interpreted mineralisation as planned, bias is considered non-existent to minimal.</li> </ul>
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	
<b>Sample security</b>	<i>The measures taken to ensure sample security.</i>	<ul style="list-style-type: none"> <li>Samples are collected by Company personnel in calico bags, which are in turn placed in bulka bags which are secured on wooden pallets and transported directly via road freight to the laboratory with a corresponding submission form and consignment note.</li> <li>The laboratory checks the samples received against the submission form and notifies the Company of any missing or additional samples. Once the laboratory has completed the assaying, the pulp packets, pulp residues and coarse rejects are held in the Laboratory's secure warehouse until collected by the Company or approved to be discarded.</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>There is no documentation available at the time of this announcement which describes the historical sample handling and submission protocols during the WMC drilling programmes;</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>however, it is assumed that due care was taken with security of samples during field collection, transport and laboratory analysis. The historical drill core remaining after sampling was stored and catalogued at the KNO core farm (now Gold Fields, St Ives' core farm) and it remains at this location to the present day.</p> <ul style="list-style-type: none"> <li>All drill core retrieved from the core farm and samples collected as part of the Lunnon Metals historical drill core re-sampling programme was done so by the Lunnon Metals Exploration Manager, the Site Representative and/or the Lunnon Metals Field Services Superintendent over a period of time. Once samples had been collected Lunnon Metals staff personally transported the samples on a daily basis in a closed and secure vehicle directly to the Intertek sample preparation facility in Kalgoorlie along with the requisite sample submission forms. Occasionally, collected samples remained overnight at the core farm in a secure locked room before being transported to Intertek Kalgoorlie.</li> </ul>
<b>Audits or reviews</b>	<i>The results of any audits or reviews of sampling techniques and data.</i>	<ul style="list-style-type: none"> <li>No external audits or reviews have been undertaken at this stage of the programme.</li> </ul> <p><u>WMC Historical data</u></p> <ul style="list-style-type: none"> <li>Cube Consulting Pty Ltd are independent of Lunnon Metals and have been previously retained to complete the grade estimation for nickel mineralisation models and MRE exercises but also to review and comment on the protocols developed by Lunnon Metals to deal with, and thereafter utilise, the historical WMC Resources' data, in particular the re-sampling and QAQC exercise completed by Lunnon Metals such that the data is capable of being used in accordance with current ASX Listing Rules where applicable and JORC 2012 guidelines and standards for the generation and reporting of MREs.</li> <li>Cube has documented no fatal flaws in the work completed by Lunnon Metals in this regard.</li> </ul>

## SECTION 2 REPORTING OF EXPLORATION RESULTS

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<p><i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></p> <p><i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></p>	<ul style="list-style-type: none"> <li>The property is located on granted Mining Leases. Although all of the tenements wholly or partially overlap with areas the subject of determined native title rights and interests in the two Ngadju determinations, the company notes that the original grant of the right to mine pre-dates 23 December 1996 and as such section 26D of the Native Title Act will be applied to exempt any future renewals or term extensions from the right to negotiate in Subdivision P of the Act.</li> <li>The complete area of contiguous tenements that are the subject of this announcement is collectively referred to as the Kambalda Nickel Project ('KNP') area. Gold Fields Ltd's wholly owned subsidiary, St Ives Gold Mining Company Pty Ltd (SIGM) was the registered holder and the beneficial owner of the Project area until the Lunnon Metals IPO.</li> <li>The rights to nickel and gold on the Project area were governed by an Option and Joint Venture Agreement ('JVA') executed between Lunnon Metals and SIGM which, in summary, granted rights to nickel and gold to Lunnon Metals in such a manner and form as if Lunnon Metals were the tenement holder, until such time as the JV farm-in commitments were met at which point the requisite percentage interest (initially 51%) was to be transferred to Lunnon Metals.</li> <li>Lunnon Metals and SIGM subsequently varied the JVA and executed a Sale and Purchase Agreement whereby Lunnon Metals, upon listing on the ASX, now holds 100% of the rights and title to the Project, its assets and leases, subject to certain select reservations and excluded rights retained by SIGM, principally relating to the right to gold in defined areas and the rights to process any future gold ore mined at their nearby Lefroy Gold Plant.</li> <li>The KNP comprises 19 tenements, each approximately 1,500 m by 800 m in area, and three tenements on which infrastructure may be placed in the future. The KNP area tenement numbers are as follows:  M15/1546;      M15/1548;      M15/1549;      M15/1550;  M15/1551;      M15/1553;      M15/1556;      M15/1557;  M15/1559;      M15/1568;      M15/1570;      M15/1571;  M15/1572;      M15/1573;      M15/1575;      M15/1576;  M15/1577;      M15/1590;      M15/1592;  and additional infrastructure tenements:  M15/1668;    M15/1669;    M15/1670.</li> <li>There are no known impediments to potential future development or operations, subject to relevant regulatory approvals, over the leases where significant results have been reported.</li> <li>The tenements are in good standing with the Western Australian Department of Mines, Industry Regulation and Safety.</li> </ul>
<b>Exploration done by other parties</b>	<p><i>Acknowledgment and appraisal of exploration by other parties.</i></p>	<ul style="list-style-type: none"> <li>In relation to nickel mineralisation, WMC, now BHP Nickel West Pty Ltd and a wholly owned subsidiary of BHP Ltd, conducted all relevant exploration, resource estimation, development and mining of the mineralisation at Foster and Jan mines from establishment of the mineral licences through to sale of the properties to SIGM in December 2001.</li> <li>SIGM has conducted later gold exploration activities on the Project area since 2001, however until nickel focused work recommenced</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>under Lunnon Metals management, no meaningful nickel exploration has been conducted since the time of WMC ownership and only one nickel focussed surface diamond core hole, with two wedge holes, have been completed in total since WMC ownership.</p> <ul style="list-style-type: none"> <li>Total production from Foster was 61,129 nickel tonnes and from Jan was 30,270 nickel tonnes.</li> </ul>
<b>Geology</b>	<i>Deposit type, geological setting and style of mineralisation.</i>	<ul style="list-style-type: none"> <li>The relevant area is host to both typical 'Kambalda' style, komatiitic hosted, nickel sulphide deposits and Archaean greenstone gold deposits such as routinely discovered and mined in Kambalda/St Ives district.</li> </ul>
<b>Drillhole Information</b>	<p><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes:</i></p> <ul style="list-style-type: none"> <li><i>easting and northing of the drillhole collar</i></li> <li><i>elevation or RL (elevation above sea level in metres) of the drillhole collar</i></li> <li><i>dip and azimuth of the hole</i></li> <li><i>down hole length and interception depth hole length.</i></li> </ul>	<ul style="list-style-type: none"> <li>Drill hole collar location and directional information is provided within the body of the report and also within the relevant Additional Details Table in the Annexures.</li> <li>DDH drilling reported herein is included in plan and cross sectional orientation maps where relevant or able to assist the interpretation.</li> <li>Due to the long plunge extents and ribbon like nature of many of the targeted nickel shoots at Warren, long projections are considered the most appropriate format to present most results, especially if there are insufficient drill hole intercepts to present meaningful, true cross sections.</li> </ul>
<b>Data aggregation methods</b>	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i>	<ul style="list-style-type: none"> <li>Grades are reported as intervals recording down-hole length and interpreted true width where this estimation is able to be made.</li> <li>Any grades composited and reported to represent an interpreted mineralised intercept of significance are reported as drill-length weighted averages over that intercept.</li> <li>The Company currently considers that grades above 0.5% Ni are worthy of consideration for individual reporting in any announcement of additional details tables provided.</li> <li>Composite nickel grades may be calculated typically to a 0.5% Ni cut-off with intervals greater than 1.0% reported as "including" in any zones of broader lower grade mineralisation.</li> <li>Other composite grades may be reported above differing cut-offs however in such cases the cut off will be specifically stated.</li> <li>Reported intervals may contain internal waste however the resultant composite must be greater than either the 0.5% Ni or 1.0% Ni as relevant (or the alternatively stated cut-off grade).</li> <li>As per other Kambalda style nickel sulphide deposits the Lunnon Metals composites reported may include samples of very high nickel grades down to lower grades approaching the 0.5% Ni or 1.0% Ni cut-off as relevant.</li> <li>Gold assay results, if reported, are done so to a minimum cut-off grade of 1.0g/t Au and maximum internal dilution of 1.0m.</li> <li>No top-cuts have been applied to reporting of assay results.</li> <li>No metal equivalent values have been reported.</li> <li>Other elements of relevance to the reported nickel mineralisation, such as Cu, Co, Fe, Mg and the like, are reported where the nickel grade is considered significant.</li> </ul>
<b>Relationship between mineralisation</b>	<i>If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.</i>	<ul style="list-style-type: none"> <li>In regard nickel exploration, the general strike and dip of the Lunnon Basalt footwall contact and thus the zones of contact nickel sulphides are considered to be well defined by past drilling which generally allows for true width calculations to be made regardless of the density or angle of drilling.</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>widths and intercept lengths</b>	<i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i>	<ul style="list-style-type: none"> <li>For nickel and gold exploration, drillhole design seeks to plan the drill holes to be approximately perpendicular to the strike of mineralisation.</li> <li>Reported intersections are approximate, but may not be true width, as drilling is not always exactly perpendicular to the strike/dip of mineralisation.</li> <li>Improved estimates of true widths will only be possible when all results are received, and final geological interpretations have been completed.</li> </ul>
<b>Diagrams</b>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views.</i>	<ul style="list-style-type: none"> <li>Plans, long projections and sections, where able to clearly represent the results of drilling, are provided in the main body of the report.</li> <li>Due to the long plunge extents and ribbon like nature of many of the targeted nickel shoots at Warren, long projections are considered the most appropriate format to present most results, especially if there are insufficient drill hole intercepts to present meaningful, true cross sections.</li> </ul>
<b>Balanced reporting</b>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	<ul style="list-style-type: none"> <li>Drill collar locations of drilling completed by Lunnon Metals are shown in figures and all results of that drilling, including those with no significant assays, are provided in this report.</li> <li>If relevant, drill holes with pending assays are also shown in figures.</li> <li>The report is considered balanced and in context.</li> <li>The Company highlights the historical drill database contains more than 5,000 drillholes and more than 100,000 nickel assays (and more than 145,000 gold assays) and thus summary tables are provided in the Appendices A through D to the independent Technical Assessment Report attached to the Company's Prospectus lodged with the ASX on 11 June 2021. These Appendices note and record: <ul style="list-style-type: none"> <li>nickel drillholes with significant assays i.e. the number of drillholes containing at least one assay value greater than or equal to 1.0% Ni versus total number of holes in the database;</li> <li>number of nickel assay values greater than or equal to 1.0% in the database;</li> <li>number of drillholes containing at least one assay value greater than or equal to 1.0 ppm Au versus total number of holes in the database; and</li> <li>number of gold assay values greater than or equal to 1.0 ppm in the database.</li> </ul> </li> </ul>
<b>Other substantive exploration data</b>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	<ul style="list-style-type: none"> <li>Drilling across the KNP is on-going.</li> <li>The KNP has a long history of geological investigation, primarily for nickel, but also gold to a lesser degree.</li> <li>Datasets pertinent to the KNP that represent other meaningful and material information include: <ul style="list-style-type: none"> <li>Geophysics - multiple ground and aerial based surveys of magnetic, gravity, SAM, characteristics</li> <li>Geochemistry – nickel and gold soil geochemistry datasets across the KNP</li> </ul> </li> <li>Historical production data recording metallurgical performance of Foster mine nickel delivered to the Kambalda Concentrator</li> </ul>
<b>Further work</b>	<i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i>	<ul style="list-style-type: none"> <li>The planned two year (June 2021 - June 2023) work programme is summarised in the Prospectus dated 22 April 2021 and announced on the ASX on 11 June 2021.</li> <li>In general terms, the current nickel mineral resources at Foster are not closed off down-plunge and also have potential for further definition drilling up-plunge. Whilst some testing of these areas can</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>be achieved via surface diamond and/or RC drilling, typically it would be undertaken from underground drill platforms which are yet to be established.</p> <ul style="list-style-type: none"> <li>• In relation to the Warren drilling results reported in this announcement, further deep DD continues. Such drilling will also provide material for metallurgical testing and provide litho-structural data to aid the later geological modelling and grade estimation process.</li> </ul>
