

16 January 2023

## ASX RELEASE

---

### Renegade assumes control of Mongoose Project.

---

#### Highlights

- Renegade and MIM agree terms to exclude EPM8588 near Cloncurry from its Carpentaria Joint Venture.
- Renegade assumes sole rights to explore and develop minerals on EPM8588 which hosts the primary Mongoose Prospect with previous highlight intercepts of 44m @ 1.7% Cu and 0.17g/t of Au from 2m including 11m @ 5.9% Cu and 0.56 g/t Au from 6m
- Planned field and drilling programs are well advanced to commence work immediately.

**Renegade Exploration Limited (ASX:RNX) has reached an agreement with Carpentaria Joint Venture (CJV) partner Mount Isa Mines Limited (MIM) to become sole operator and funder of EPM 8588, host to a number of advanced copper prospects including the Mongoose Project.**

Located just south of Cloncurry, Mongoose is a primary target given significant historical gold intercepts and its location along strike from the neighbouring Great Australia Mine and Taipan Deposit.

Renegade Director, Mr Robert Kirtlan, said he was looking forward to commencing work at an advanced prospect like Mongoose.

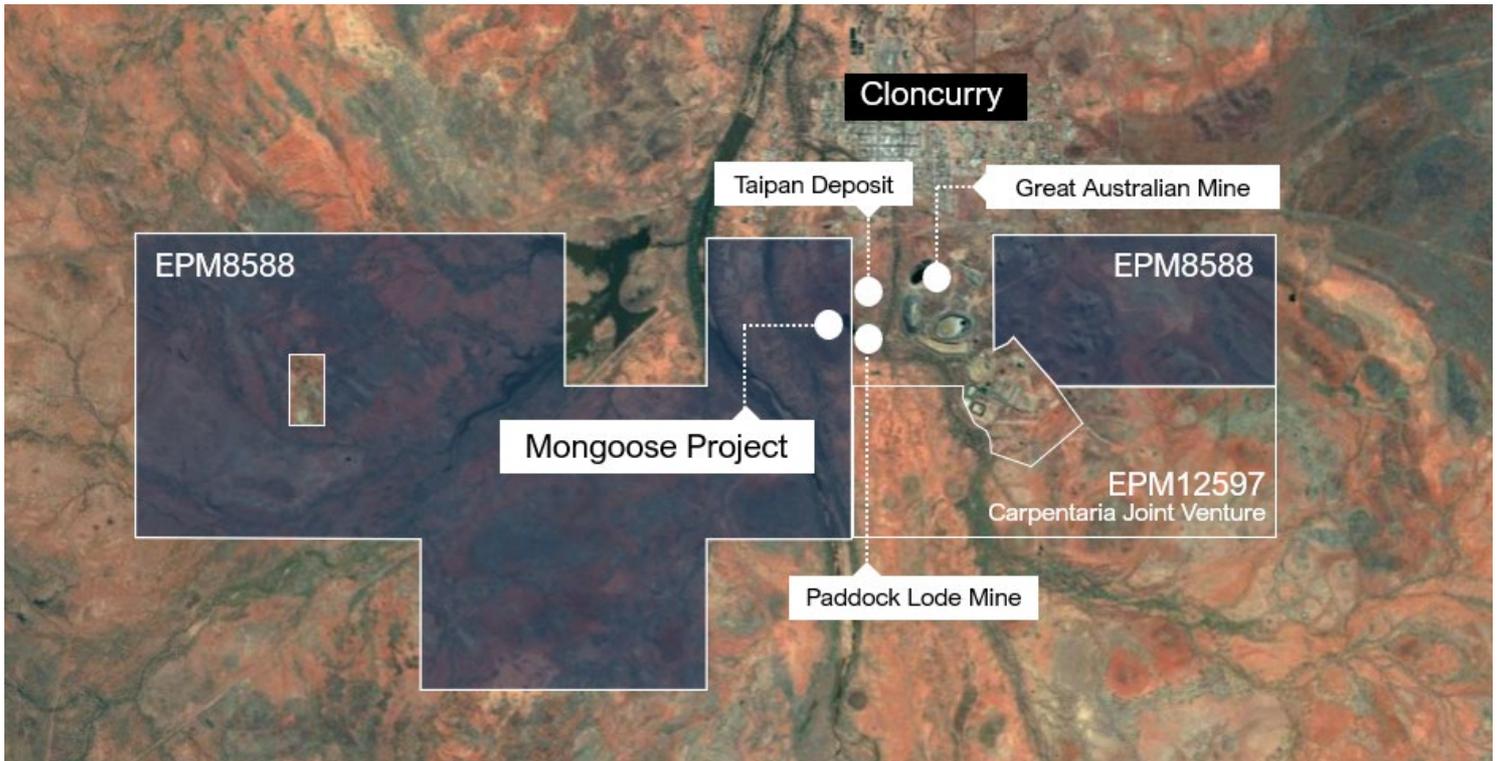

“Mongoose was first discovered in 2013 and has had approximately 4,000m of drilling which confirms it as an extension to the neighboring Paddock Lode mine and Taipan deposit,” Mr. Kirtlan said.

“We are well advanced with our modelling of Mongoose and already have preliminary drill plans in place so we will be seeking any relevant clearances as soon as possible and commencing work immediately.

“EPM 8588 is located adjacent to the Cloncurry townsite so is strategically located right next to all the infrastructure Renegade needs. The permit also has a number of immediate other prospects to

follow up and these will be included in our initial fieldwork programs.”

**Figure 1.** Mongoose Project, showing nearby open pit mines and resources.

“We are finalizing the new structure of the Excluded Joint Venture with MIM as this is the first time the sole risking or Earn Back terms have been triggered in the Carpentaria Joint Venture. Renegade will become the operator of EPM 8588 and terms of the Excluded Joint Venture will be similar to the terms of the existing CJV<sup>1</sup>.” he said.

### **Carpentaria Joint Venture (CJV) Background**

Renegade acquired a 23% interest in the CJV in December 2020 which covers several exploration permits near the well-known mining towns of Cloncurry, Mary Kathleen and Duchess in north-west Queensland. The partner is Mount Isa Mines Limited. Led by the Mongoose Prospect, the CJV has a number of interesting prospects which require further work to determine economic viability.

Mongoose is hosted by dolerite-gabbro-porphyrific basalts of the Toole Creek Formation. The mineralised zone is dominated by magnetite-actinolite-albite-chlorite altered, sheared and brecciated dolerites. The mineralisation is both primary and supergene in nature. The supergene zone is defined by the presence of malachite, chrysocolla, chalcocite, and cuprite. The fresh, primary (hypogene) copper mineralisation is defined by chalcopyrite with accessory pyrite.

The work completed by the CJV during the early 2010’s delineated an extensive coincident magnetic-chargeable anomaly. Based on the coincident anomalies, CJV completed 3,988.1 m of reverse circulation (RC) and diamond drilling over 21 drill holes during 2013/2014. This drilling is

<sup>1</sup> See ASX Release dated 17 December 2020

exclusively orientated towards the south and has intercepted large zones of Cu-Au mineralisation at surface and depth including;

- 44 m @ 1.7 % Cu & 0.17 g/t Au from 2 m (MGX009)
- 11 m @ 1.2 % Cu & 0.31 g/t Au from 20 m (MGX019)
- 6 m @ 1.0 % Cu & 0.34 g/t Au from 98 m (MGX017)
- 15 m @ 1.6 % Cu & 0.32 g/t Au from 174 m (MGX002)
- 10 m @ 0.95 % Cu & 0.12 g/t Au from 8 m (MGX011)
- 28 m @ 0.66 % Cu % 0.067 g/t Au from 105 m (MGX010)
- 5m @ 1.7% Cu and 0.42g/t of Au from 20 m (MGX005)

## About Renegade Exploration Limited

Renegade Exploration Limited (ASX:RNX) is an Australian based minerals exploration and development company with an interest in the Carpentaria Joint Venture which covers a package of advanced copper and gold projects in Queensland's Cloncurry mining district of Queensland. The Company's immediate primary focus is the Mongoose Project located at Cloncurry. This project has been excised from the Carpentaria Joint Venture and is advanced in terms of exploration activity. The company has recently expanded its north-west Queensland interests by a 75% interest in a joint venture on the North Isa Project, located just north of MIM's George Fisher mining operations.

## **Competent Person Statement and Geological Information Sources**

Information on the Mongoose Prospect, the subject of this ASX Release, is sourced from the Queensland Department of Resources and data supplied by Mt Isa Mining Limited.

The information in this announcement that relates to geological information for the Mongoose Project is based on information compiled by Mr. Edward Fry, who is an employee of the Company. Mr. Fry is a Member of the Australian Institute of Mining and Metallurgy. Mr. Fry has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and the activity he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results (JORC Code). Mr. Fry consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.

The Company confirms that it is not aware of any new information or data that materially affects the information included in this market announcement.

The following tables are provided to ensure compliance with JORC Code (2012) requirements for exploration results for the Mongoose Prospect Project in Qld.

## JORC Code, 2012 Edition – Table 1:

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>Samples were collected at 1 m intervals. Four samples were collected from each 1 m interval using the spear sample technique.</li> <li>The average sample weight was 3.46 kg.</li> <li>Samples were pulverized to produce a 30 g charge for multi-acid digest (ME-ICP61) and fire assay for gold (Au-AA21). Over range Au samples (&gt;1 ppm) were reanalysed using the Au-AA25 fire assay method.</li> <li>The diamond drilling was samples using 1 m intervals of half core in prospective zones and 2 m of half core in relatively unmineralised country rock.</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Reverse Circulation (RC) drilling.</li> <li>Diamond drilling (DD).</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>RC bags were visually assessed for adequate and consistent recovery by a geologist at the rig site. Any poor recoveries and or wet samples were documented.</li> <li>Four samples were collected from each 1 m RC bag using the spear sample technique.</li> <li>No relationship exists between sample recovery and grade, hence no bias is expected.</li> <li>No information regarding the diamond drilling recoveries have been located to date.</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>Logging</b>	<ul style="list-style-type: none"> <li>• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>• Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>• The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>• Drill chips were all geologically logged, recording relevant data using a set template to log geological intervals. All data was codified to a set company codes systems. The company feels that this offers sufficient detail for the purpose of interpretation and further studies.</li> <li>• All logging included lithological features, sulphide % and type if present, alteration and descriptions of chips.</li> <li>• 100% of the drill chips were logged.</li> <li>• 100 % of the diamond core was logged.</li> </ul>
<b>Sub- sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li>• If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>• If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>• For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>• Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>• Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>• Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>• Spear sample technique.</li> <li>• Sample preparation is consistent with industry standards.</li> <li>• Field QC procedures involve the use of certified reference material assay standards, blanks, duplicates, replicates for company QC measures, and laboratory standards, replicate assaying and barren washes for laboratory QC measures. The insertion rate of these averaged better than 1:25.</li> <li>• A blank was inserted at the beginning of every hole and every 25 samples before the insertion of the standard OREAS 44 P standard was used. Duplicate samples were included at a ratio of approximately 1:25.</li> <li>• The sample size is appropriate for the material sampled.</li> <li>• No information regarding the 1 diamond drill hole sampling technique has been located within the historical data.</li> </ul>
<b>Quality of assay data and laboratory tests</b>	<ul style="list-style-type: none"> <li>• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>• For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>• Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>• The assaying and laboratory procedures are considered as being appropriate for reporting copper and gold ore mineralization, according to industry best practice.</li> <li>• No assay results were obtained outside of the laboratory.</li> <li>• A total of three standard materials were used, obtained from OREAS. Blanks were inserted at the beginning of the hole and every 25 samples before insertion of a standard. Duplicates were included at a rate of 1:25.</li> <li>• No information regarding the diamond drilling QAQC technique has been located to date.</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>Verification of sampling and assaying</b>	<ul style="list-style-type: none"> <li>• The verification of significant intersections by either independent or alternative company personnel.</li> <li>• The use of twinned holes.</li> <li>• Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>• Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>• Significant mineralisation intersections were verified by alternative company personnel.</li> <li>• No twinned holes were drilled.</li> <li>• All data was collected initially on paper logging sheets, codified to the company's templates.</li> <li>• No adjustments have been made.</li> <li>• No information regarding the diamond drilling verification technique has been located to date.</li> </ul>
<b>Location of data points</b>	<ul style="list-style-type: none"> <li>• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>• Specification of the grid system used.</li> <li>• Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>• Hand-held GPS.</li> <li>• All surveys were MGA zone 54 (GDA).</li> <li>• Topographic control is sufficient for this stage of exploration.</li> </ul>
<b>Data spacing and distribution</b>	<ul style="list-style-type: none"> <li>• Data spacing for reporting of Exploration Results.</li> <li>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>• Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>• Drill spacing at this point of exploration was irregular as drilling targeted IP anomalies.</li> <li>• N/A</li> <li>• No sample compositing occurred.</li> </ul>
<b>Orientation of data in relation to geological structure</b>	<ul style="list-style-type: none"> <li>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>• If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul style="list-style-type: none"> <li>• No bias attributable to orientation of sampling upgrading of results has been identified as mineralisation is thought to be horizontal.</li> <li>• NA</li> </ul>
<b>Sample security</b>	<ul style="list-style-type: none"> <li>• The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>• Standard sample security protocols were observed.</li> <li>• No information regarding the diamond drilling sample security protocols have been located to date.</li> </ul>
<b>Audits or reviews</b>	<ul style="list-style-type: none"> <li>• The results of any audits or reviews of sampling techniques and data.</li> </ul>	<ul style="list-style-type: none"> <li>• Audit of sampling techniques and data were carried out. The data was of good quality and fit for purpose. It is considered by the company that industry best practice methods have been employed at all stages of the exploration.</li> <li>• No information regarding the diamond drilling audit has been located to date.</li> </ul>

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>• The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>• The company owns 23.03 % of the Carpentaria JV properties in QLD namely EPM 8588, 8586, 1280, 12597, and 12561. These tenements are located on the Mitakoodi people's traditional land.</li> <li>• The tenement is in good standing and no known impediments exist.</li> </ul>
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>• Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>• Exploration was undertaken by Mount Isa Mines Limited according to the terms of the Joint Venture.</li> </ul>
<b>Geology</b>	<ul style="list-style-type: none"> <li>• Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>• The mineralisation style targeted is an Iron-Oxide-Copper-Gold (IOCG) system, recognized on a number of deposits in the Eastern Fold Belt of the Mount Isa Inlier.</li> </ul>
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:               <ul style="list-style-type: none"> <li>➤ easting and northing of the drill hole collar</li> <li>➤ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>➤ dip and azimuth of the hole</li> <li>➤ down hole length and interception depth</li> <li>➤ hole length.</li> </ul> </li> <li>• If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>• Refer to tables 1 and 2</li> <li>• All information is included</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>Data aggregation methods</b>	<ul style="list-style-type: none"> <li>• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>• Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated</li> <li>• and some typical examples of such aggregations should be shown in detail</li> </ul>	<ul style="list-style-type: none"> <li>• Intercepts were reported using the length weighted average technique.</li> <li>• High grade intercepts within broad low grade intervals have been separated as “included” results.</li> <li>• No metal equivalents have been used.</li> </ul>
<b>Relationship between mineralisation widths and intercept lengths</b>	<ul style="list-style-type: none"> <li>• The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> <li>• These relationships are particularly important in the reporting of Exploration Results.</li> <li>• If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>• If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., ‘down hole length, true width not known’).</li> </ul>	<ul style="list-style-type: none"> <li>• Mineralisation is thought to be sub-horizontal as per the diagram.</li> <li>• Mineralization geometry is not clearly defined to date but is estimated to be sub-horizontal. Therefore, down hole widths are thought to be approximate to true width.</li> </ul>
<b>Diagrams</b>	<ul style="list-style-type: none"> <li>• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	<ul style="list-style-type: none"> <li>• See the above figures</li> </ul>
<b>Balanced reporting</b>	<ul style="list-style-type: none"> <li>• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>• Representative reporting of low and high grades has been effected within this report.</li> </ul>
<b>Other substantive exploration data</b>	<ul style="list-style-type: none"> <li>• Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	<ul style="list-style-type: none"> <li>• Further drilling is planned for exploration.</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>Further work</b>	<ul style="list-style-type: none"><li>• The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling).</li><li>• Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li></ul>	<ul style="list-style-type: none"><li>• The nature of future work will revolve around drilling results and further field inspections of anomalous geochemical results, and mapping of the alteration and distinctive features relevant for an economic mineral deposit</li></ul>
