MAJOR GOLD EXTENSION CONFIRMED AT GOLDEN GATE

FIRST THREE HOLES INTERSECT BROAD GOLD MINERALISATION UP TO 305.7m @ 0.64 G/T AU FROM SURFACE, EXTENDING KNOWN MINERALISATION AT LEAST 2KM SOUTH OF GOLDEN GATE NORTH

HIGHLIGHTS

- **Broad gold mineralisation confirmed from first three holes at Golden Gate South**: Initial assays from the first three diamond holes have returned significant gold mineralisation in all three holes, including standout intercepts of **305.7m @ 0.64 g/t Au** from surface in HH-GG26- 003C.

- **305.7m gold intercepts include multiple higher grade zones**: HH-GG26-003C (Figure 2) intersected gold mineralisation from surface to the base of the hole, including.
    - **6.5m @ 1.33g/t Au** from 62m; and
    - **17.25m @ 1.19g/t Au** from 264.85m

- **Golden Gate mineralised footprint materially extended at Golden Gate South**: Results from the first three diamond core drill holes extend known gold mineralisation at least 2,000 metres south of Golden Gate North, providing further evidence of the scale potential of the broader Golden Gate system.

- **Gold mineralisation intersected** confirming "discovery status" at Golden Gate South (Figures 3 & 4), including:
    - **49.5m @ 0.58 g/t Au** from surface in drill hole HH-GG26-001C;
    - **32.6m @ 0.49 g/t Au** from surface in drill hole HH-GG26-002C; and
    - **305.7m @ 0.64 g/t Au** from surface in drill hole HH-GG26-003

- **Significant drilling completed with major assay pipeline ahead:** A total of 33 diamond holes for approximately 9,700m have now been completed at Golden Gate, with a further 28 drill holes logged and submitted to the lab for assay. Results will be progressively released as they become available.

- **Large-scale 2026 drill program continuing:** Resolution's Golden Gate program comprises up to 13,700m of diamond drilling across up to 45 holes targeting the scale and extent of both gold and tungsten mineralisation across Golden Gate South and Golden Gate North (*ASX announcement 18 March 2025)*.

- **Drilling extended through mid-September: Planned drill program timeline extended:** The timeline for the ongoing 2026 Golden Gate drill program has been extended to mid-September, allowing RML to complete all planned holes.

Resolution Minerals Ltd (**ASX: RML; OTCQB: RLMLF**) ("**Resolution**" or the "**Company**") is pleased to report that a discovery has been confirmed of near-surface gold mineralisation at Golden Gate South in its 2026 drill program at its 100% owned Horse Heaven Antimony-Tungsten-Gold-Silver Project ("Horse Heaven"), Idaho, USA (Figure 5). Gold mineralisation has been intersected in all three diamond core drill holes with reported assay results, extending gold mineralisation at least 2,000 metres south from Golden Gate North to Golden Gate South (Figures 3 & 4).

Assays were received for three drill holes HH-GG26-001C, HH-GG26-002C and HH-GG26-003C, all drilled as fan-holes from the same drill platform at the southern-most end of Golden Gate South (Table 2).

Wide intercepts of gold mineralisation with higher grade zones:

Gold mineralisation extends from surface downhole to the base of hole in drill hole HH-GG26-003C.

Drill hole HH-GG26-003C: **305.7 metres @ 0.64 g/t Au** from surface;

Including: **6.5m @ 1.33g/t Au** from 62.0m downhole;

24.2m @ 0.77 g/t Au from 61.0m-85.2 m downhole;

17.25m @ 1.19g/t Au from 264.85m downhole;

26.0m @ 0.80 g/t Au from 223.32m-249.32m downhole; and

31.2m @ 0.87 g/t Au from 260.2m-291.4m downhole.

Drill hole HH-GG26-002C: **32.6m @ 0.49 g/t Au** from surface; and

87.87 m @ 0.52 g/t Au from 48.97m-136.84 m downhole

Including: 18.75 m @ 0.60 g/t Au from 9.15m-27.9m downhole, and

Including: 37.42 m @ 0.72 g/t Au from 67.24m-104.66m downhole.

Drill hole HH-GG26-001C: **49.5m @ 0.58 g/t Au** from surface; and

13.39 m @ 0.44 g/t Au from 208.1m-221.89m downhole

Including: 24.64 m @ 0.78 g/t Au from 17.86m-42.4m downhole.

Further drill hole assays are pending and will be released progressively once fully available.

Craig Lindsay, Resolution's CEO of US Operations, stated: *"Our exploration team is extremely encouraged by these three discovery holes at Golden Gate South, which provide additional support to our view that mineralisation extends continuously from Golden Gate South to Golden Gate North, potentially representing a very significant gold discovery along the Golden Gate Fault Zone. With 28 additional holes in process at the lab, RML expects to see an increased pace of drill results released to the market."*

Exploration Rationale for Golden Gate South Drill Program

All three reported drill holes were designed to test the southern extension of the Golden Gate Shear Zone, which at this location is developed within sheared and faulted Cretaceous granodiorite of the Idaho Batholith. The different drill orientations were selected to evaluate the geometry and geological controls of the target zone.

The drill-site location and hole designs were based on the integration of several independent exploration datasets, including:

- Gold and tungsten anomalies identified by the 2021 soil-geochemical survey;
- Sampling of mineralised surface outcrops; and
- Geophysical responses identified by the 2022 controlled-source audio-frequency magnetotelluric (CSAMT) survey *(all detailed in ASX announcement 11 June 2025)*.

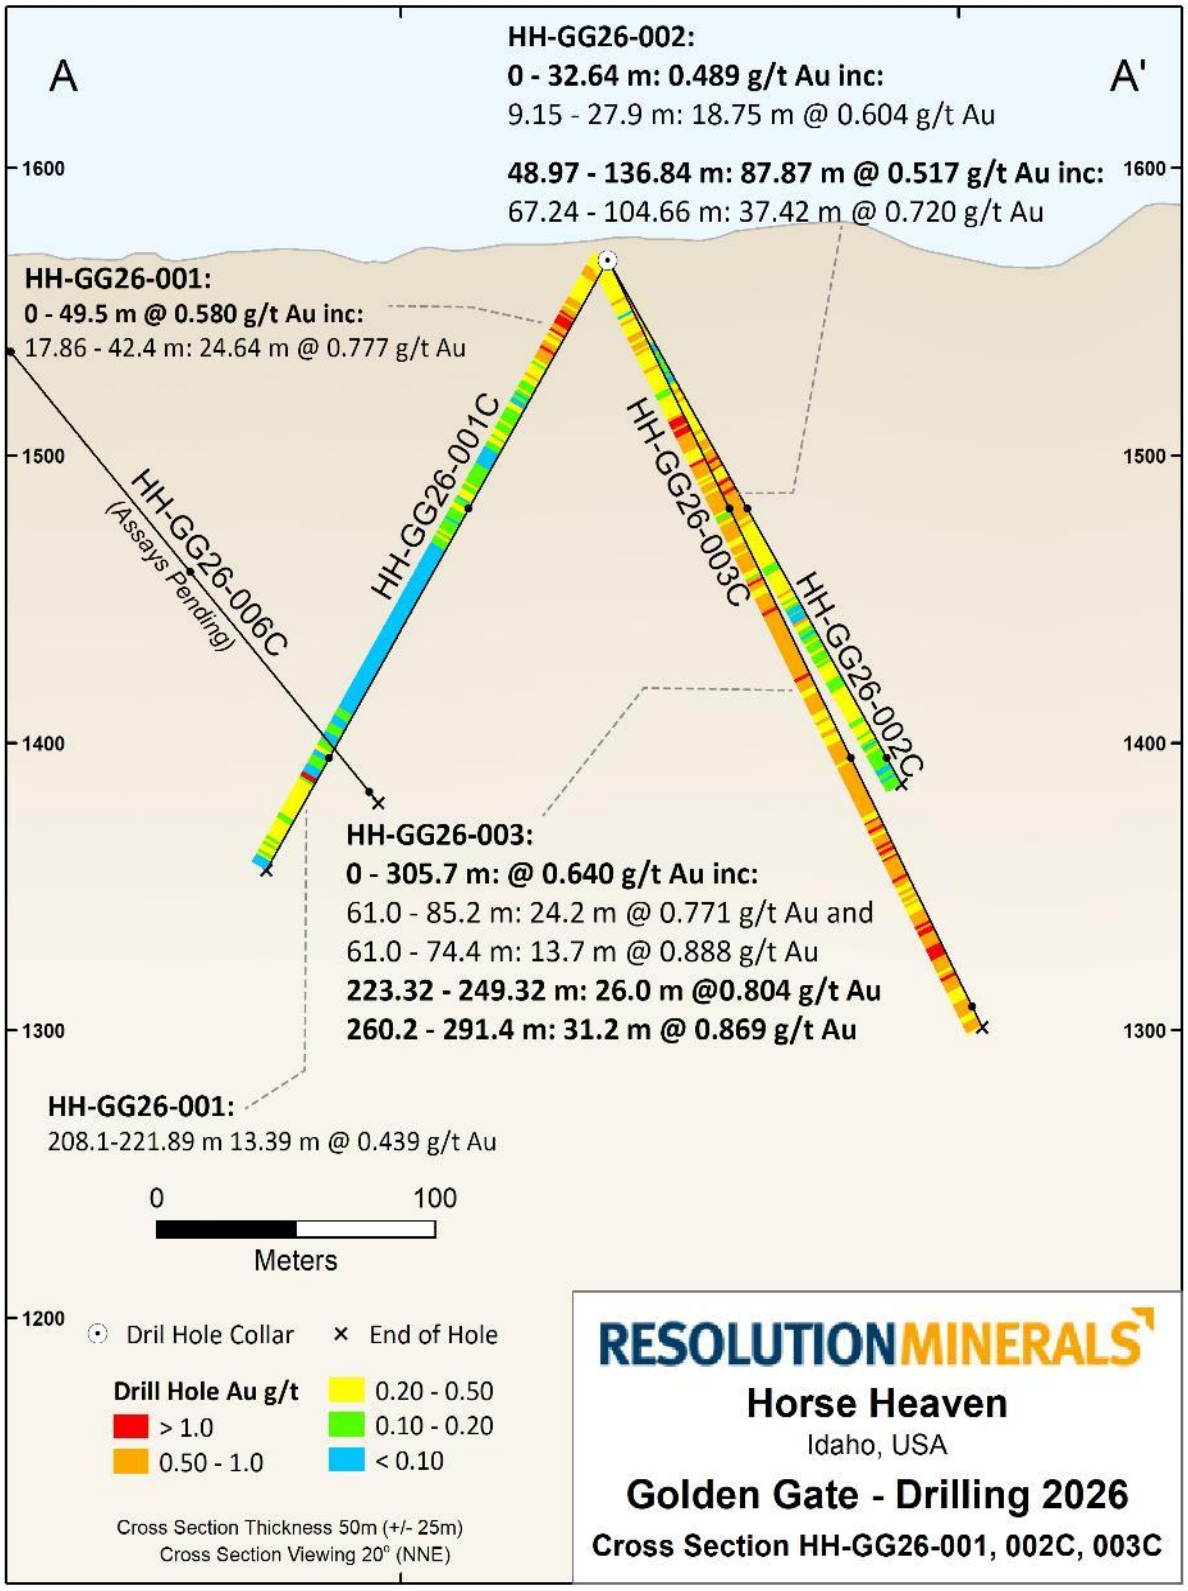

***Figure 2**: Resolution's Golden Gate South – Cross section of three reported drill hole gold assays as colours from blue to red with significant gold intervals.*

Objectives of the 2026 Drill Program

The 2026 Golden Gate drill program comprises up to 13,700 metres (45,000 ft) of diamond core drilling, across up to 45 holes, is to target and define the scale and extent of tungsten and gold mineralisation at Golden Gate, with initial drilling starting at Golden Gate South and later progressing to Golden Gate North. Golden Gate is located within RML's Horse Heaven Antimony-Tungsten-Gold-Silver Project in Idaho, USA, immediately adjacent to the recently permitted Perpetua Resources' Stibnite Gold Project.

Geological Summary of Three Reported Drill holes from Golden Gate South

The three holes were drilled as fan-holes from the same drill platform (Drill Site 11) and intersected variably foliated, sheared and faulted Cretaceous granodiorite of the Idaho Batholith. Alteration is widespread and consists principally of sericite-pyrite alteration of mafic minerals, sericite-clay alteration of feldspars and zones of weak to strong silicification.

Pyrite occurs as a replacement of primary minerals and within quartz-pyrite veins and shear seams. Vein density and pyrite content generally increase within the more intensely deformed and silicified intervals, supporting the interpretation that the Golden Gate Shear Zone provided a pathway for hydrothermal fluids.

Gold mineralisation appears to be present with arsenopyrite and pyrite in quartz veins and in gouge shear zones in each drill hole. Anomalous silver assays appear to be associated with base metals.

Drill hole HH-GG26-01C intersected intense silica-healed shearing, centimetre-scale fault breccias and strong silicification from 58–86 metres, followed by moderate silicification to 110.49 metres. Significant veining included an approximately 4-metre-wide quartz vein from 196.4 metres and a 9-centimetre pyrite-bearing vein containing trace arsenopyrite. Intense deformation decreased below a late, barren andesitic dyke at approximately 205 metres.

Drill hole HH-GG26-02C intersected increasing ductile shearing below approximately 134.5 metres, associated with a 6.8-metre-wide quartz vein from 136.2 metres. Silicification increases below 124.5 metres and is strongest around the principal quartz vein. Pyrite-bearing veins and shear seams, generally less than 2 centimetres wide, increase in density toward the sheared and silicified zone, locally reaching approximately three to eight veins per metre.

Drill hole HH-GG26-03C intersected several brittle fault zones, including a mineralised shear from 207.5–208.8 metres and more intense faulting between 244.0 and 257.7 metres. Quartz-pyrite veining occurs throughout the hole and becomes more concentrated within sheared intervals. Wider mineralised quartz veins were intersected from 221.0–222.1 metres and 249.5–250.0 metres.

All reported intervals are downhole lengths and do not necessarily represent true widths. The presence of alteration, silicification, quartz veining and visible pyrite is based on geological observations and does not indicate economic mineralisation.

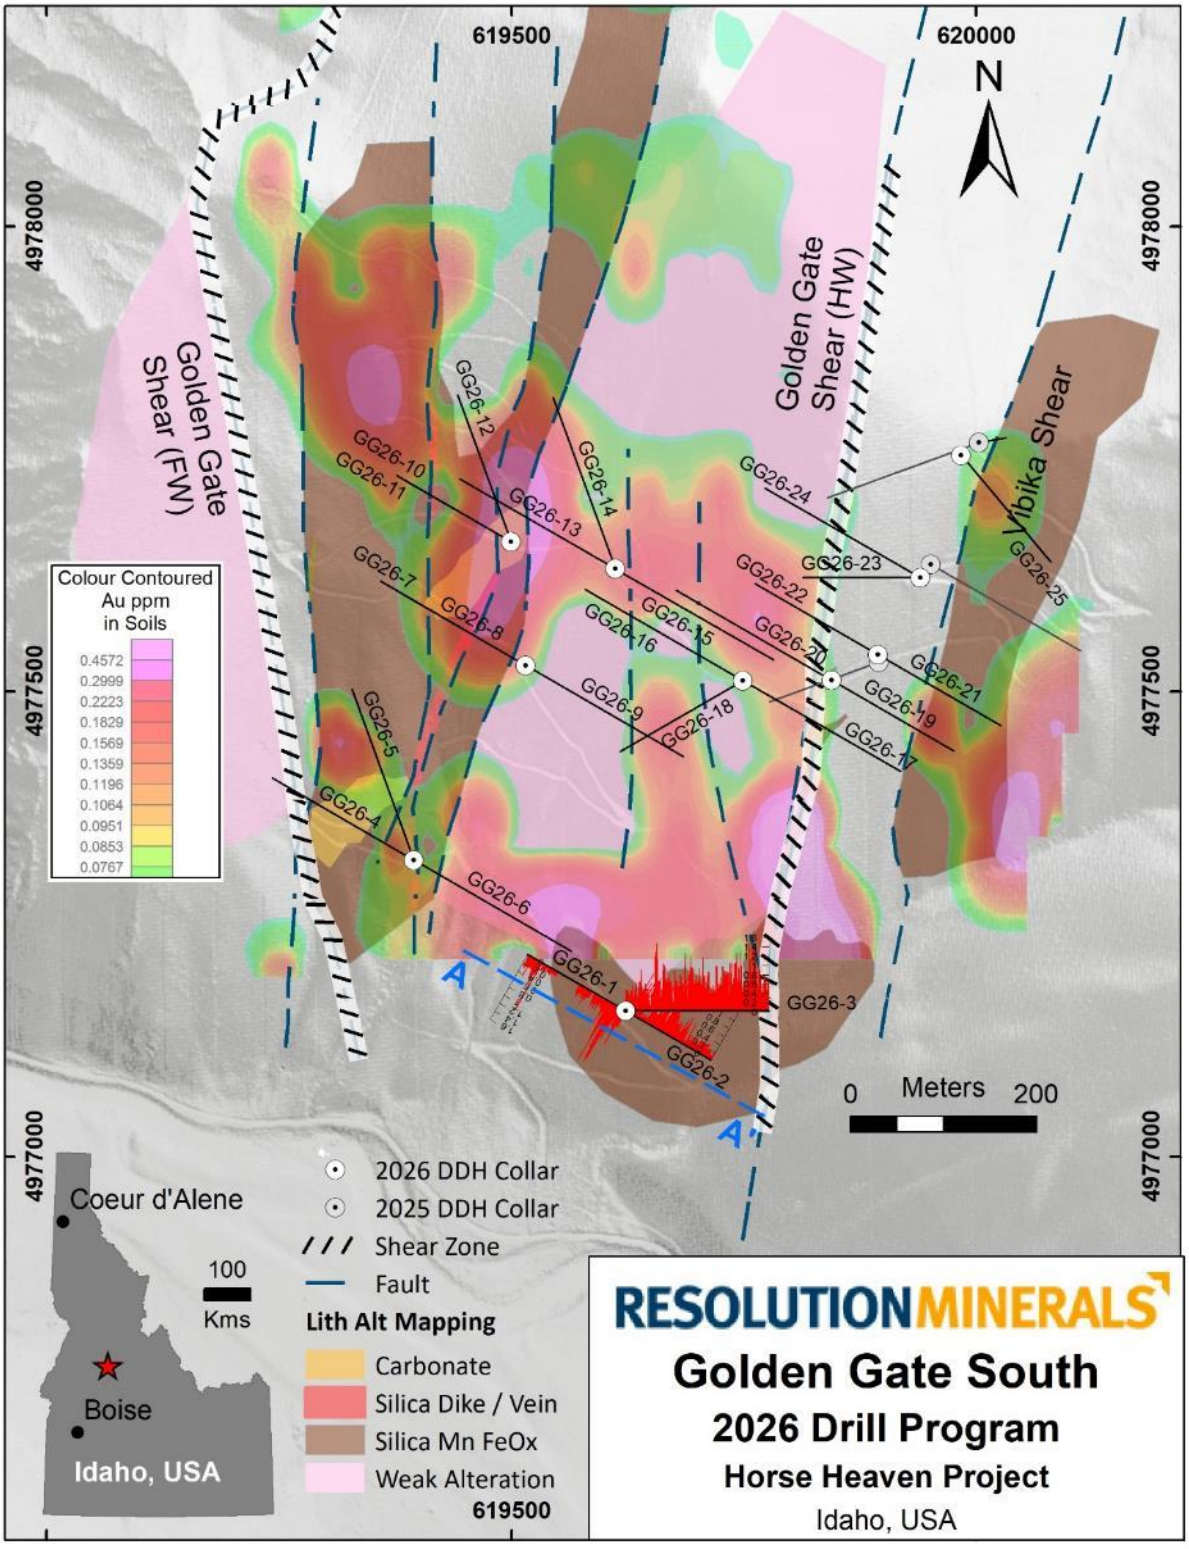

***Figure 3**: Resolution's Golden Gate South – Location of drill holes over coloured gold-in-soil-samples and interpreted mineralisation and alteration with three reported drill hole gold assays as histograms (red) and location of Cross section in Figure 2. Gold-in-soil-samples emphasises the continuity of gold mineralisation between drilled areas (from ASX announcement 11 June 2025).*

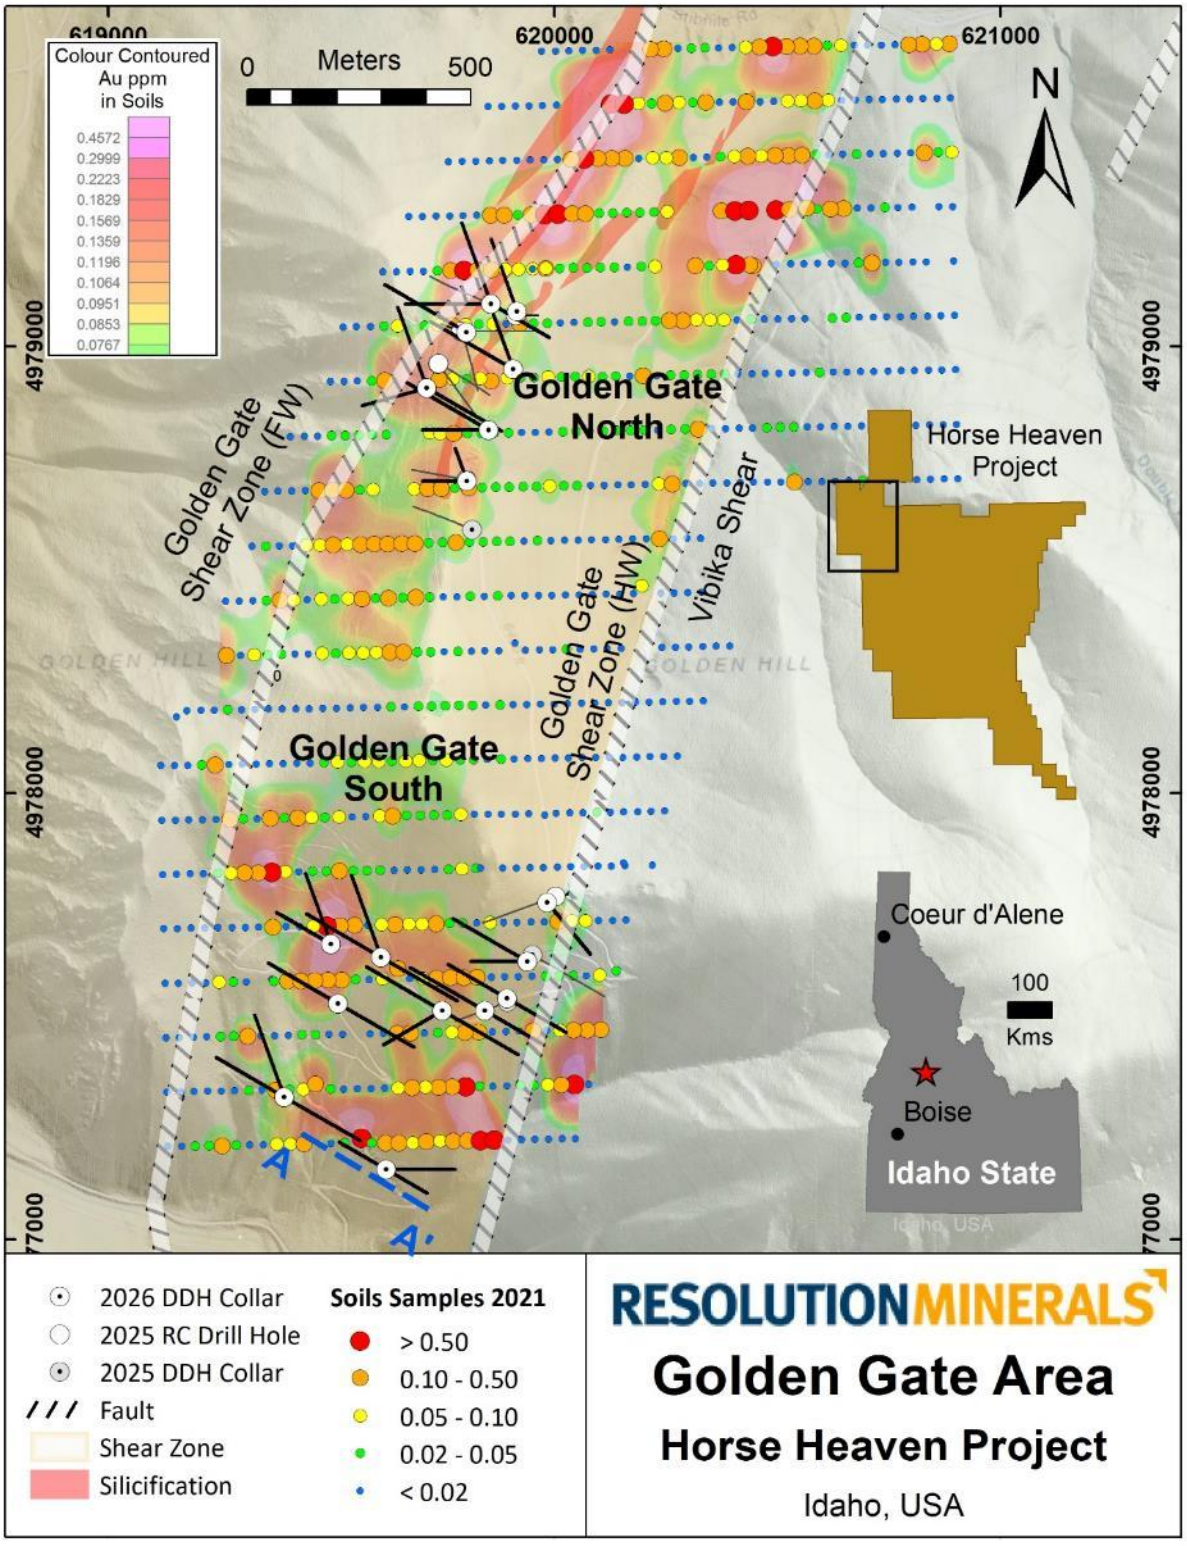

***Figure 4**: Resolution's Golden Gate South and Golden Gate North within the Horse Heaven Project – Location of drill holes over coloured gold-in-soil-samples with the location of Cross section in Figure 2. Gold-in-soil-samples emphasises the continuity of gold mineralisation between Golden Gate South and Golden Gate North and between drilled areas (from ASX announcement 11 June 2025).*

Major extension to gold mineralisation confirms discovery status at Golden Gate South

Significant pervasive gold mineralisation, identified in all three diamond core drill holes, extends gold mineralisation at least 2,000 metres south of the hill at Golden Gate North, confirming "discovery status" at Golden Gate South.

The Golden Gate South prospect has a history of exploration dating back to the late 1970's, when a subsidiary of Canadian Superior Mining Company undertook a regional reconnaissance program around the Stibnite District to identify additional economic gold, tungsten and antimony deposits. Of the numerous prospects examined, the Golden Gate South prospect was identified as having the strongest potential. In 1980, surface mapping and trench sampling identified both scheelite and gold mineralisation. A systematic 1982 soil survey further demonstrated the potential for significant geochemical zoning across Golden Gate South, while a 2021 close-spaced soil and rock-chip program conducted by Stallion Gold Corp provided important additional definition and confirmed structural controls associated with the Golden Gate Shear Zone and Vibika Creek fault.

Drilling assay results, soil sampling, geophysics and geological mapping has now confirmed the discovery and presence of gold mineralisation at Golden Gate South.

Planned 2026 drill program timeline extended at Golden Gate

The timeline for the 2026 Golden Gate drill program has been extended to mid-September, allowing RML to complete all planned holes. A total of thirty three (33) diamond core holes have been drilled and completed to date at the Golden Gate, for a total of 9,700m.

Subsequent drill holes targeted tungsten and gold mineralisation at Golden Gate

Subsequent drill holes to those reported herein have targeted a combination of both gold and tungsten mineralisation, including a significant tungsten in soil anomaly identified at Golden Gate South.

Forward Looking Statements

This announcement may contain forward-looking statements. These statements relate to the Company's expectations, beliefs, intentions or strategies regarding the future. These statements can be identified by the use of words like "anticipate", "believe", "intend", "estimate", "expect", "may", "plan", "project", "will", "should", "seek" and similar words or expressions containing same. These forward-looking statements reflect the Company's views and assumptions with respect to future events as of the date of this release and are subject to a variety of unpredictable risks, uncertainties, and other unknowns. Actual and future results and trends could differ materially from those set forth in such statements due to various factors, many of which are beyond our ability to control or predict. These include, but are not limited to, risks or uncertainties associated with the acquisition and divestment of projects, joint venture and other contractual risks, metal prices, exploration, development and operating risks, competition, production risks, sovereign risks, regulatory risks including environmental regulation and liability and potential title disputes, availability and terms of capital and general economic and business conditions.

Given these uncertainties, no one should place undue reliance on any forward-looking statements attributable to the Company, or any of its affiliates or persons acting on its behalf. Subject to any continuing obligations under applicable law, the Company disclaims any obligation or undertaking to disseminate any updates or revisions to any forward-looking statements in this announcement to reflect any change in expectations in relation to any forward-looking statements or any change in events, conditions or circumstances on which any such statement is based.

JORC cross references

The Company confirms it is not aware of any new information or data that materially affects the information cross referenced in this announcement and further to "Agreement to Acquire Major US Antimony Project and Placement" on 11 June 2025, "Exceptional Rock Chip and Soil Results from Antimony Ridge" on 15 September 2025, "Exceptional Rock Chip and Soil Results Update" on 24 September 2025, "Significant Gold Discovery at Horse Heaven Project" on 28 October 2025, "Significant Gold Discoveries Continue at Golden Gate" on 3 November 2025, "Golden Gate Discovery Grows with Multiple Gold Intercepts" on 2 December 2025, "Further Ultra High Grade Antimony and Silver Results" on 14 January 2026, "New Gold Discovery at Golden Gate South" on 9 February 2026, "Gold & Significant Tungsten Mineralisation in Drilling" on 17 February 2026,"Exceptional Tungsten Grade Identified in Stockpile Material" on 26 March 2026, "Antimony Ridge Model Shows Extensive Vein Swarms" on 10 April 2026, "Antimony Trioxide Produced from Antimony Ridge" on 14 April 2026, "Tungsten Concentrates Produced from Golden Gate" on 28 April 2026, "Tungsten and Gold Drilling Underway and High Gold Recoveries" on 15 May 2026, and "First 2026 Gold and Tungsten Drilling Proving Encouraging" on 21 May 2026. Competent Person's Statement

The information in this report that relates to exploration results relating to metallurgy, is based on and fairly represents information reviewed and compiled by Mr Ross Brown BSc (Hons), M AusIMM, Principal Geologist/director of exploration consulting firm, Riviere Minerals Pty. Ltd, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Brown has sufficient experience, which is relevant to the exploration activities, style of mineralisation and types of deposits under consideration, and to the activity which has been undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Riviere Minerals is consulting to Resolutions Minerals Limited and consents to the inclusion in this announcement of the matters based on their information in the form and context in which it appears.

Appendix C: JORC Code, 2012 Edition

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• This announcement provides an update of the Company's 2026 drill program currently being conducted at its Horse Heaven Project in Idaho, USA, and contains exploration results of three drill holes with the ID reference HH-GG26-001C, HH-GG26-002C and HH-GG26-003C. • Reported exploration results (data) includes: drill hole type, drill hole location (UTM metric) and drill hole parameters (dip, azimuth, altitude and end of hole data); sample data; assay data; and geological data. Supporting data includes drill collar locations in UTM metric data, together with dip, azimuth, altitude and end of hole data. • Reported assay data is for gold. • Please note that the primary data of the core samples (start, finish, interval) were converted from imperial feet measurements to metric metres in this announcement. Note that the operating jurisdiction uses imperial measurement system. • The assay data is derived independent professional laboratory services company of submitted core samples from HH-GG26-001C, HH-GG26-002C and HH-GG26-003C. • HH-GG26-001C, HH-GG26-002C and HH-GG26-003C are diamond core holes. Sample intervals are contiguous and range in length individually from 2.2ft to 5.2ft (averaging 4.5ft). The samples are half-cut core prepared by industry standard core cutting saw by qualified personnel. • Samples were taken for the majority of the hole depth except where rock voids were encountered.

Criteria	JORC Code explanation	Commentary
		• Geological data is derived from detailed geological and geotechnical logging by qualified personnel. • Drill core sample assay results of the above-mentioned holes are included in this announcement. • References to mineralised intersects are included in this announcement.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• The Drilled Holes are diamond core drill holes that were drilled by Evolve Exploration Ltd using two Multipower MP1500 modular core rigs providing HQ diamond drill core. • The drill core is oriented. The core orientation method is conducted using the ACTxCore Orientation System.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Drill core recovery of the drilled holes have been consistently high (a function of the solid lithologies) approaching 100%. Lower core recovery rates are sometimes observed in fault zones, with the most significant losses usually occurring near the top of the drill hole, close to the collar, with core recoveries of approximately 50% recovery. This lower core recovery represents <1% of the total length of the drill hole.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Drill core was logged for lithology, alteration, mineralisation, structure (geotechnical) using oriented core to a level which has enabled preliminary interpretations relating to style of mineralisation, host and thickness. At this stage no Mineral Resource Estimates, mining studies or metallurgical studies are appropriate. • Drill core is also logged for RQD and Core recovery. • Drill core is then digitally photographed wet while whole after logging. • The logging, as described above is both quality and quantitative.

Criteria	JORC Code explanation	Commentary
		• 100% of the relevant intersections were logged as per above.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• The HQ core was halved using a diamond core saw and sampled on geological intervals approximating 0.2m to 1.5m in length. The smallest intervals selected to specifically target mineralised veins have used down to 0.2m intervals. The 1.5 metre interval is most commonly applied across the core. • Drill core is being halved using an electric powered core saw by RML contract staff who maintain possession of the core at its Antimony Camp facility. • Half-cut core samples will be bagged and tagged using bar-coded sample tags and were securely stored prior to shipment at the Antimony Camp facility. • Half cut core samples were transported by RML contractors under lock and key to ALS prep' lab' facility in Twin Falls, ID. No third-party shippers were involved in the shipping process; chain of custody forms were exchanged at ALS Minerals in Twin Falls and a copy kept on file. The remaining boxed cut core are kept at a secure locked facility at Antimony Camp, ID. • ALS Minerals Twin Falls prep' lab' logs in the samples using the sample tag bar codes provided. Samples were then crushed to 70% less than 2mm, rotary split off 250g, pulverise split to better than 85% passing 75 microns. • All samples were then shipped to ALS Minerals analytical laboratory in Vancouver, British Columbia.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.*	• Gold was assayed by analytical method Au-AA23: Au by fire assay and AAS 30g nominal sample weight. • Multielement analysis was by analytical method ME-ICP61: 34

Criteria	JORC Code explanation	Commentary
	• *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.*	elements by HF-HNO3-HClO4 acid digestion, HCl leach and ICP-AES. Quantitatively dissolves nearly all elements for the majority of geological materials. Only the most resistive minerals, such as Zircons, are only partially dissolved. • No geophysical tools, spectrometers, handheld XRF instruments, etc.. were used in the generation of the assay data. • Certified reference materials (CRM) from an ISO certified supplier were inserted randomly into the sample stream at a ratio of 2%. CRMs were obtained for Meg LLC of Reno, Nevada; two separate CRMs were used for gold: a low grade and high-grade standard. • Blank material was inserted randomly in the sample stream at a ratio of 2%. Blank material is commercially available pea-gravel that has been previously tested for gold concentrations.t. • Duplicates samples were collected by quarter cutting the core at randomly selected intervals. Two quarter-cut portions of core were sent for analysis; the remaining half is kept at a secure facility. Core intervals of poor recovery were not used for duplicate samples. Duplicate core samples were inserted into the sample stream at a ratio of 2%.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• No verification of the "significant intersections" has been completed to date by either independent or alternative company personnel. The company acknowledges the material nature of the results and is planning a program of select verification assays. Such were the immediacy of the results, these verifications were not possible prior to the release of the initial results.

Criteria	JORC Code explanation	Commentary
		• The Company is confident that its sample security processes are adequate for the interim period. • The announcement details drill holes HH-GG26-001C, HH-GG26-002C and HH-GG26-003C. Note that these three drillholes were drilled on the same platform but were drilled in different directions (Figure 2). By this HH-GG26-001C, HH-GG26-002C and HH-GG26-003C are fanned holes. No holes are twinned (same collar, same azimuth, same dip). • Sample results, certificates and results were sent via email to RML site contractors in Antimony Camp where results are analysed and interpreted. • No assay adjustments have been carried out.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The locations of the Drilled Holes were achieved using handheld GPS programmed into the local coordinate system. The accuracy of the GPS is in line with best practice standards.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• The assay data spacing of HH-GG26-001C, HH-GG26-002C and HH-GG26-003C, the length and frequency of each sample and the collective coverage of the drill holes are best practise in terms of hole sample representativeness. • In terms of geological data spacing associated with the Drilled Holes every metre of these holes was logged, with details of lithology, alteration, mineralisation recorded to sub-metre detail.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.*	• The Drilled Holes have a drill direction that is approaching perpendicular to the regional trend (lithologically and structurally) and also approaching perpendicular to the known mineralisation. The purpose of the Drilled Holes was to

Criteria	JORC Code explanation	Commentary
	• *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	test the possible extension of known gold and tungsten mineralisation at surface at depth along strike from past drill holes and past surface sample results and to test the occurrence of gold in un-oxidised rocks at depth. • *Cautionary Note*: There is currently insufficient data pertaining to sampling orientation and the local-scale orientation of mineralisation to determine the true width of the gold intervals in these holes. Additional holes in all directions are required to determine whether the gold mineralisation is broadly pervasive or (to various degrees) spatially constrained. For example, if the gold mineralisation is broadly pervasive, then the gold intervals in this announcement are true widths. If the gold mineralisation is spatially constrained, then the gold intervals in this announcement are not true widths. Based in increasing data, the gold mineralisation is interpreted as being broadly pervasive in association with a structurally-controlled repeating host sequence of country-rock granites and fault breccias
Sample security	• *The measures taken to ensure sample security.*	• All drill core samples were delivered directly to RML's geologists on site where they remain under direct supervision at a secure site.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• The competent person is unaware of the undertaking of audits or reviews for sampling technique and data, other than its own review.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, past sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• This announcement refers to exploration results regarding drill core at Golden Gate, a project within the one larger project, Horse Heaven project in Idaho USA, comprising seven hundred and twenty-nine (729) U.S. Federal lode mining claims covering 14,580 acres and includes seven hundred and nineteen (719) mining claims and ten lode mining claims referred as the Oberbillig Group. • The competent person understands that the mining claims are all in good standing.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• No exploration results reported in this announcement were performed by other parties.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The project area is dominated by Cretaceous-aged granitic rocks relating to intrusive phases associated with the Atlanta Lobe of the Idaho Batholith. These largely granodiorite rocks have intruded Neoproterozoic-aged metasediments, comprising quartzites (which are dominant) calc-silicates, marble and black shale. The area and broader region is affected by broad regional folding and N-S, NNE-SSW, and NE-SW faults. • Gold, antimony, tungsten and silver mineralisation is associated with hydrothermally altered and fractured granodiorites.
Drillhole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes:* ○ *easting and northing of the drillhole collar* ○ *elevation or RL (Reduced Level –*	• The drillhole information for the Drilled Holes is included in a table (Table1) with drill collar location data, altitude, dip, azimuth, and end of hole.

Criteria	JORC Code explanation	Commentary
	elevation above sea level in metres) of the drillhole collar ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• In reporting downhole gold intersections results of HH-GG26-001C, HH-GG26-002C and HH-GG26-003C, no maximum and minimum truncations or cutt off grades were used. • In reporting downhole gold intersections/intervals, assay results of HH-GG26-001C, HH-GG26-002C and HH-GG26-003C, weighted averages were required due to the fact that sample lengths were variant (between 2.2ft and 5.2ft). The sample interval length was multiplied by the sample assay data then divided by the total length of the interval. • No metal equivalents were used in this announcement.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• With reference to the Drilled Holes, these holes were drilled close to perpendicular across the prospect-scale orientation of the known mineralisation. • There is insufficient data pertaining to the gold mineralisation identified the Drilled Holes to allow conclusive statements concerning the sampling orientation and the local-scale orientation of mineralisation. Therefore the true width nature of the reported widths of the mineralisation is not known.

Criteria	JORC Code explanation	Commentary
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views.*	• A drill hole location plan and cross section are provided with geolocation information (coordinates, northing and scale bar) showing the locations of the Drilled Holes. Legends are included within each figure (where appropriate) and when additional explanation is required, this is given to the figure caption. • A drill hole location plan and cross section are provided in this announcement to provide a sense of location of the hole in relation: to i) other drill holes; and ii) intersected mineralisation. The cross sections include a geological interpretation
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• This announcement is considered to be fair and balanced with respect to the exploration results, being a drilling update.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• There is no other material data associated with the Drilled Holes not mentioned in this announcement.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• The Drilled Holes, subject of this announcement, are part of a large diamond core drill program (up to 45-holes and 13,700m), which is ongoing. • Drill hole results will be released on an ongoing basis.
