## New Discovery at the El Zorro Gold Project

1.5 km Long Gold Trend with Surface Samples up to $101.00 \mathrm{~g} / \mathrm{t} \mathrm{Au}$

- Assay results received for first pass sampling program west north-west of Ternera.
- New 1.5 km long and up to 450 m wide, undrilled gold trend identified in outcrop.
- Results include:
- 3.00 m @ 101.50g/t Au;
- $1.00 \mathrm{~m} @ 12.75 \mathrm{~g} / \mathrm{t} \mathrm{Au}$;
- $1.20 \mathrm{~m} @ 12.70 \mathrm{~g} / \mathrm{t} A u$; and
- $\quad 6.00 \mathrm{~m} @ 1.63 \mathrm{~g} / \mathrm{t} \mathrm{Au}$.
- Gold mineralisation is associated with north-west trending fault system within the El Zorro Tonalite (EZT) and sedimentary rock sequences.
- The main gold host rock at El Zorro, the EZT has been mapped for a further 4.5 km north northwest of Ternera.
- Detailed channel sampling and mapping programs underway to define additional drill targets.

[^0]Significant results are presented in Table 1. All results are presented in Appendix 1.

## Tesoro Managing Director Zeff Reeves commented:

"These results highlight the prospectivity of the El Zorro Gold Project to host additional gold mineralisation outside of the Ternera Gold resource. We are excited by the potential shown to the north-west of Ternera with extensive outcrops of El Zorro Tonalite having been mapped over 4 km from Ternera and some very strong zones of outcropping gold mineralisation. El Zorro continues to emerge as a new gold district in Chile."

Figure 1: El Zorro Geology map and channel sampling locations of significant results highlighting a newly discovered 1.5 km gold trend. Mapped EI Zorro Tonalite in pale pink. PSAD565 19S datum.

Table 1: Significant channel sampling results reported in this announcement, results are uncut, no top cut has been applied. All new channel sampling results are presented in Appendix 1.

## RESULTS DISCUSSION

First pass geological mapping and sampling has identified a new 1.5 km long gold trend with continuous gold anomalism returned from sampling the western margin of the Ternera Gold Deposit, through the Drone Hill Prospect and open to the north-west.
High grade channel sample results are associated with a major north-west trending fault system up to 450 m wide, which is interpreted to have acted as a conduit for gold bearing fluids. Faults are mineralised within sedimentary rocks and the main gold host rock at El Zorro, the EZT.
In addition extensive outcrops of the favourable EZT have been mapped continuously up to 4.5 km north of the Ternera Gold Deposit. The Company believes this further highlights the significant gold prospectivity that exists at El Zorro with excellent potential for additional gold mineralisation outside of Ternera.

The gold mineralisation identified and the mapped EZT is open to the west and the north. Additional mapping and sampling programs are currently underway to define further drill targets.

Authorised by the Board of Tesoro Resources Limited.

#### Abstract

About Tesoro Tesoro Resources Limited was established with a strategy of acquiring, exploring, and developing mining projects in the Coastal Cordillera region of Chile. The Coastal Cordillera region is host to multiple world class copper and gold mines, has well established infrastructure, service providers and an experienced mining workforce. Large areas of the Coastal Cordillera remain unexplored due to the unconsolidated nature of mining concession ownership, but Tesoro, via its in-country network and experience has been able secure rights to a district scale gold project in-line with the Company's strategy. Tesoro's $95 \%$ owned Chilean subsidiary owns $85 \%$ of the El Zorro Gold Project.

\section*{Competent Persons Statement} 

The information in this report that relates to Exploration Results is based on information compiled by Mr Zeffron Reeves (B App Sc (Hons) Applied Geology) MBA, MAIG). Mr Reeves is a member of the Australian Institute of Geoscientists and a Director and shareholder of the Company. Mr Reeves has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Reeves consents to the inclusion in this report of the matters based on this information in the form and context in which it appears.

The information in this report that relates to Mineral Resources is based on information compiled by Mr Daniel Saunders, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Saunders is a full-time employee of Cube Consulting Pty Ltd, acting as independent consultants to Tesoro Resources Limited. Mr Saunders has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. The Company confirms that it is not aware of any new information or data that materially affects the Mineral Resource information included in the original announcement on 28 July 2021 and all material assumptions and technical parameters underpinning the estimates in the original announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the applicable Competent Persons' findings are presented have not been materially modified from the original announcement.

## Future Performance

This announcement may contain certain forward-looking statements and opinion. Forward-looking statements, including projections, forecasts and estimates, are provided as a general guide only and should not be relied on as an indication or guarantee of future performance and involve known and unknown risks, uncertainties, assumptions, contingencies and other important factors, many of which are outside the control of the Company and which are subject to change without notice and could cause the actual results, performance or achievements of the Company to be materially different from the future results, performance or achievements expressed or implied by such statements. Past performance is not necessarily a guide to future performance and no representation or warranty is made as to the likelihood of achievement or reasonableness of any forward-looking statements or other forecast. Nothing contained in this announcement, nor any information made available to you is, or and shall be relied upon as, a promise, representation, warranty or guarantee as to the past, present or the future performance of Tesoro.

Section 1: Sampling Techniques and Data

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Sampling techniques | - Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. | Tesoro completed channel sampling. Sampling processes are considered appropriate for the style of mineralisation. |
|  | - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. | Tesoro completed channel sampling, Sampling processes are considered appropriate for the style of mineralisation. Channel sampling sites were painted across the sample site by Tesoro geologists to the width of the sample. Surficial material was removed from the sample. |
|  | - Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done; this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. | Tesoro has completed a channel sampling program of 309 samples. Sampling was by industry standard technique including: <br> - location of the station using handheld GPS. <br> - Outcrop is brushed with a hand held brush to clean off surficial debris prior to sampling. <br> - A continuous rock chip sample is hammered off the outcrop along the painted sample line. <br> - Samples of up to 2 kg of rock are packed in plastic bags with assay-number tickets stapled to the bag. |
| Drilling techniques | - Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, facesampling bit or other type, whether core is oriented and if so, by what method, etc.). | No drilling has been completed in the reported results of this report. |
| Drill sample recovery | - Method of recording and assessing core and chip sample recoveries and results assessed. | No drilling has been completed in the reported results of this report. |
|  | - Measures taken to maximise sample recovery and ensure representative nature of the samples. | No drilling has been completed in the reported results of this report. |
|  | - Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. | No drilling has been completed in the reported results of this report. |
| Logging | - Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. | No drilling has been completed in the reported results of this report. |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  | - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. | No drilling has been completed in the reported results of this report. |
|  | - The total length and percentage of the relevant intersections logged. | No drilling has been completed in the reported results of this report. |
| Subsampling techniques and sample preparation | - If core, whether cut or sawn and whether quarter, half or all core taken. | No drilling has been completed in the reported results of this report. |
|  | - If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. | No drilling has been completed in the reported results of this report. |
|  | - For all sample types, the nature, quality and appropriateness of the sample preparation technique. | No drilling has been completed in the reported results of this report. |
|  | - Quality control procedures adopted for all subsampling stages to maximise representivity of samples. | No drilling has been completed in the reported results of this report. |
|  | - Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. | No drilling has been completed in the reported results of this report. |
|  | - Whether sample sizes are appropriate to the grain size of the material being sampled. | No drilling has been completed in the reported results of this report. |
| Quality of assay data and laboratory tests | - The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. | Tesoro's channel sampling program, was undertaken using a 50 g fire assay technique for gold. <br> QAQC data was monitored and reported by Cube Consulting. Reviewing the summary of results by Cube the overall survey is of reasonable quality and fit for purpose for geochemical exploration. |
|  | - For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | Standard chemical analyses were used for grade determination. There was no reliance on determination of analysis by geophysical tools. |
|  | - Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. | Standards and blanks have been inserted into the sample stream every 20 samples, which is deemed acceptable for a program of this nature. |
| Verification of sampling and assaying | - The verification of significant intersections by either independent or alternative company personnel. | No drilling has been completed in the reported results of this report. |
|  | - The use of twinned holes. | No drilling has been completed in the reported results of this report. |
|  | - Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. | Sample data is digitally entered and stored following documented sample and data handling protocols which have been reviewed by CSA Global. The protocols are considered adequate. |
|  | - Discuss any adjustment to assay data. | No adjustments were made to Tesoro geochemistry |
| Location of data points | - Accuracy and quality of surveys used to locate drill holes (collar and downhole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. | Sample locations have been located using a handheld GPS |
|  | - Specification of the grid system used. | The El Zorro Project uses the PSAD56 grid system |
|  | - Quality and adequacy of topographic control. | The topography generated from a detailed topographic survey and generation of a DTM |

| Criteria | JORC Code explanation | Commentary |
| :--- | :--- | :--- |
| Data spacing <br> and distribution | -Data spacing for reporting of Exploration <br> Results.The channel sampling is collected on a nominal 1m long <br> channel, up to a maximum of 3m. this spacing is <br> deemed acceptable for the style of mineralisation. |  |
|  | - Whether the data spacing and <br> distribution is sufficient to establish the <br> degree of geological and grade continuity <br> appropriate for the Mineral Resource and <br> Ore Reserve estimation procedure(s) and <br> classifications applied. | The channel sample spacing is deemed appropriate for <br> this stage of exploration. |
|  | - Whether sample compositing has been <br> applied. | No compositing has been used |
| Orientation of <br> data in relation <br> to geological <br> structure | - Whether the orientation of sampling <br> achieves unbiased sampling of possible <br> structures and the extent to which this is <br> known, considering the deposit type. | Channel samples are generally, where p[possible, <br> sampled perpendicular to interpreted geological <br> structures. |
|  | - If the relationship between the drilling <br> orientation and the orientation of key <br> mineralised structures is considered to <br> have introduced a sampling bias, this <br> should be assessed and reported if <br> material. | No drilling has been completed in the reported results of <br> this report. |
| Sample security | - The measures taken to ensure sample <br> security. | Chain of Custody of digital data is managed by the <br> Company. Physical material was stored on site and, <br> when necessary, delivered to the assay laboratory. <br> Thereafter laboratory samples were controlled by the <br> nominated laboratory which to date has been ALS <br> Laboratories, Santiago. All sample collection was <br> controlled by digital sample control file(s) and hardcopy <br> ticket books. |
| Audits or reviews | - The results of any audits or reviews of <br> sampling techniques and data. | No audits have been undertaken. |

(Criteria in this section apply to all succeeding sections)

## Section 2: Reporting of Exploration Results

## (Criteria listed in the preceding section also apply to this section)

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Mineral tenement and land tenure status | - Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. | Information regarding tenure is included in the Company's September 2021 quarterly activities report released to the ASX on 29 October 2021. |
|  | - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. | The Concession is believed to be in good standing with the governing authority and there is no known impediment to operating in the area. |
| Exploration done by other parties | - Acknowledgment and appraisal of exploration by other parties. | Little historical exploration has been undertaken in either project area. Coeur d'Alene's Chilean exploration division undertook activities on the Coquetas prospect, under an option agreement with the previous owners between April 1990 and January 1993. |
| Geology | - Deposit type, geological setting and style of mineralisation. | The mineralisation model is to likely to be intrusive related gold deposit. The key characteristics that are consistent with this style deposit include: <br> - Low sulphide content, (typically $<5 \%$ ); reduced ore mineral assemblage that typically comprises pyrite and lacks primary magnetite or hematite <br> - Mineralisation occurs as sheeted vein deposits or stockwork assemblages and often combine gold with variably elevated $\mathrm{Bi}, \mathrm{W}, \mathrm{As}, \mathrm{Mo}, \mathrm{Te}$, and/or Sb but low concentrations of base metals as seen in the initial four holes by Tesoro at El Zorro <br> - Restricted and commonly weak proximal hydrothermal alteration |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  |  | - Intrusions of intermediate to felsic composition. |
| Drillhole information | - A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes: easting and northing of the drillhole collar elevation or RL (Reduced Level - elevation above sea level in metres) of the drillhole collar dip and azimuth of the hole downhole length and interception depth hole length. <br> - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. | See prospectus dated 30 ${ }^{\text {th }}$ October 2019 lodged by Plukka Ltd |
| Data aggregation methods | - In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. | El Zorro: No cutting of grades has been undertaken at this early stage of exploration. <br> Channel intercepts are calculated using a length weighted averaging method. |
|  | - Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. | Along Channel length weighted average results are calculated using a $0.20 \mathrm{~g} / \mathrm{t}$ Au cut off and a maximum of 5 m internal dilution |
|  | - The assumptions used for any reporting of metal equivalent values should be clearly stated. | No metal equivalents are reported. |
| Relationship between mineralisation widths and intercept lengths | - These relationships are particularly important in the reporting of Exploration Results. |  |
|  | - If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported. | EL Zorro: The mineralisation forms sub-vertical sheeted veins and individual veins and may form plunging zones within the mineralised structures. Drilling and sampling by Tesoro has been undertaken to test these orientations. |
|  | - If it is not known and only the downhole lengths are reported, there should be a clear statement to this effect (e.g. 'downhole length, true width not known'). | EL Zorro: Exploration results are reported as along channel widths as the true width is not known with any certainty. |
| Diagrams | - Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views. | Relevant maps and diagrams are included in the body of the report. |
| Balanced reporting | - Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. | All assay results from sampling are reported. |
| Other substantive exploration data | - Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | All material exploration data is reported in the body of the report. |
| Further work | - The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). | El Zorro: Further work will be focused on drill testing the Coquetas mineralisation and additional prospects as defined in the work program. Core will be used for metallurgical testwork and resource modelling is planned. |

| Criteria | JORC Code explanation | Commentary |
| :--- | :--- | :--- |
|  | - Diagrams clearly highlighting the areas of <br> possible extensions, including the main <br> geological interpretations and future drilling <br> areas, provided this information is not <br> commercially sensitive. | Diagrams have been included in the body of this report. |

[^0]:    Tesoro Resources Limited (Tesoro or the Company) (ASX:TSO) is pleased to announce first pass assay results from initial surface mapping and rock chip channel sampling programs on new targets at the Company's El Zorro Gold Project (El Zorro) in Chile.

    Results have been received for 309 surface rock chip channel samples over the Drone Hill Target and north-west of Drone Hill. Anomalous gold results have been reported delineating a new 1.5 km long and up to 450 m wide, surface gold trend associated with a north-west trending fault system cross cutting the EZT and sedimentary rock sequences (Figure 1).
