23rd March 2026

Dome to Commence Gold-Copper Exploration at its Nadrau Porphyry Cu-Au Project, Fiji

Dome Gold Mines Limited (“Dome” or “Company”) (ASX code: DME) is pleased to announce that it plans to commence ground exploration activities at its highly prospective Nadrau Copper-Gold Porphyry project located on the main island of Viti Levu and immediately northwest of Newmonts’ giant Namosi porphyry copper-gold project (5 Moz Au, 5.8 Mt Cu¹).

Highlights

- **Porphyry type alteration and mineralisation previously identified at the Company’s Namoli and Wainivau prospects with Cu-Au grades reported up to 1.1g/t Au and 0.56% Cu in rock chips**
- **Follow up alteration mapping and rock sampling to begin in late March-April 2026**
- **Airborne magnetics and IP geophysics programmes planned to identify targets at depth obscured below post-mineral sedimentary cover**
- **Work programme designed to deliver drill targets for large-scale porphyry copper-gold deposits**
- **Fiji hosts globally significant gold and copper deposits including Emperor mine and Newmonts’ Namosi project**
- **Project owned 100% by Dome**

Peter Hinner, Technical Director of Dome commented: *“We are excited to commence boots-on-ground exploration at our Nadrau project which is situated adjacent to Newmont’s giant Namosi porphyry copper-gold deposit in central Viti Levu and only 1.5 hours drive from the Company’s exploration office at the large provincial town of Sigatoka.*

“Feasibility Study activities at the Company’s cornerstone Sigatoka Project are sufficiently advanced for some of the Company’s resources to be directed to the Nadrau Project. Global demand and prices for both gold and battery metals have significantly strengthened over the last two years which importantly re-rates the potential opportunity at Nadrau.

“The wet season in Fiji is nearing its end at which point our team will re-establish camps and carry out exploration activities at both the Namoli and Wainivau prospect areas as a precursor to the planned airborne geophysics program that is scheduled immediately afterward. The exploration programme is designed to identify targets for the Company’s first scout drilling programme at Nadrau targeting large-scale porphyry copper-gold mineralisation.”

¹ DENVER, February 20, 2025 – Newmont Corporation (NYSE: NEM, ASX: NEM, TSX: NGT, PNGX: NEM) Reserves & Resources 2024 Highlights

NADRAU PROJECT BACKGROUND

Domes' Nadrau project (SPL 1452) is located immediately north of Newmonts' Namosi Copper-Gold project in the highly prospective provinces of Namosi and Nadroga/Navosa on Fiji's main island of Viti Levu.

- ❖ Fiji is strategically situated on the Pacific Rim of Fire known for hosting significant porphyry-epithermal Cu-Au deposits, however, the country is relatively under-explored compared with other Pacific rim countries.
- ❖ The country is highly prospective for Porphyry-Epithermal systems and hosts 3 major Copper-Gold resources all within a 40km radius of Domes Nadrau project.
- ❖ The Namosi project, a JV between Newmont (70%), Mitsubishi Corporation and Nittetsu Mining Co Ltd, is one of the world's largest undeveloped Copper-Gold deposits.
- ❖ The principal target for the Nadrau Project is a large-scale porphyry system similar to Namosi and other Pacific Ring of Fire deposits (e.g. Ok Tedi & Porgera in PNG) that was first identified by Amoco in the 1970's from stream sampling and subsequently explored by CRA (1989-92) and Placer Dome (1993-94).
- ❖ Historical drilling by Amoco at Wainivau (1973-76) comprised 5 holes that targeted IP anomalies and intersected broad zones of low-grade copper including 48.2m of 475ppm Cu (SFA-74-1) with peak copper grades up to 0.17% Cu. The Amoco drilling did not target geochemistry highs and is interpreted to have tested the outer propylitic zone of a porphyry system. Work is now required to identify and target the inner potassic zone where copper-gold grades are typically highest.
- ❖ Previous work by Dome (2013 – 2022) includes stream, rock and soil sampling with alteration mapping that identified porphyry style alteration and mineralization at the Wainivau and Namoli prospects.
- ❖ Significantly, mapping demonstrates that the central and southern extensions of prospective porphyry geology at Nadrau are obscured by post-mineral sedimentary units therefore indicating significant untested potential for mineralization at depth beneath the covered ("blind") zones.

ABOUT DOME

Dome is an Australian mining company that listed on the ASX 22nd October 2013. The Company is focussed on gold, copper, magnetite and industrial sands in Fiji, where it holds three highly prospective exploration tenements. Dome operates in Fiji through its 100% owned subsidiary Magma Mines Pty Ltd.

The company aims to become a major force in the mining industry of Fiji through the discovery and development of mineral resources within its Fijian tenements.

Dome's objective is the completion of its feasibility study at the Sigatoka project allowing it to convert exploration licence SPL1495 into a mining licence and commence production. The Sigatoka mining project would be a very low capital cost project, generating quick revenues to allow the development of its other projects.

Sigatoka is a heavy mineral sand project containing abundant magnetite and industrial sands with unique properties. Drilling to establish an initial JORC mineral resource estimate for the project has been completed, and the final stages of a feasibility study are now underway. Commencement of production at Sigatoka by conventional sand mining and wet processing is anticipated.

Dome's other projects are the Ono Island epithermal gold project, where an initial exploration diamond drilling was completed in early July 2018, and the Nadrau project SPL1452, where additional exploration programs for copper-gold porphyry deposits are planned.

Dome maintains a fulltime office and development team in Fiji and its Board and Management team has a wealth of experience in Fiji.
