

# White Devil Gold Deposit Mineral Resource Growth Continues

## HIGHLIGHTS

### White Devil Deposit, (TCMG / ERM JV) Tennant Creek – Mineral Resource Estimate (MRE) Update

- Mineral Resource Estimate of **4.7Mt @ 4.1 g/t gold for 616,200 oz of gold** completed including:
  - **Indicated Resource of 4.0Mt @ 4.3 g/t gold for 549,100 oz of gold (89%)**
  - **Inferred Resource of 0.7Mt @ 3.0 g/t gold for 67,100 oz of gold (11%)**
- **White Devil Indicated Resource increased by 18,600 oz of gold**
- **Open Pit Resource redefined within Scoping Study pit shell, resulting in 2.7Mt @ 4.7 g/t gold for 404,400 oz of gold (66% of the global Resource):**
  - **Indicated Open Pit Resource of 2.63Mt @ 4.7 g/t gold for 397,800 oz of gold (98.4%)**
  - **Inferred Open Pit Resource of 70Kt @ 2.9 g/t gold for 6,600 oz of gold (1.6%)**
- White Devil Feasibility Studies have commenced to determine the preferred development strategy
- Mineralisation remains open down dip and along strike

### Total Tennant Creek Resource base increased to **7.0Mt @ 4.4 g/t gold for 992,200 oz of gold**

- **Total Indicated Resource base of 5.6Mt @ 4.8 g/t gold for 861,000 oz of gold**

### Emmerson's Managing Director, Mike Dunbar commented:

*“Our strategy to prioritise opportunities to expand the Company’s high-grade resource base, while also increasing confidence in the resources, continues to pay dividends. The Tennant Creek Project’s high grade Mineral Resources have increased to 992,200oz.*

*“White Devil has clearly been a game changer for the Company and our JV partner. In the space of 10 months, we have identified the opportunity at White Devil, drilled 90 RC holes, completed an initial MRE and two subsequent MRE updates, and completed a scoping study. This is a credit to the team at Emmerson and our JV partner Tennant Mining / Pan African.*

*“While the global resource increase is modest at ~5,000 ounces, the conversion of almost 19,000 ounces of shallow resource to Indicated is a significant step forward. The conversion of the western extension of the deposit within the conceptual scoping study pit design to the higher confidence Indicated resource category is important for the feasibility and future development.”*

*“White Devil now contains 549,100 ounces in the Indicated resource category, which will underpin the current feasibility studies and allow a maiden Probable Ore Reserve to be estimated as part of the studies.”*

### Estimation of Mineral Resource for the White Devil Gold Deposit

Emmerson Resources Limited (**Emmerson** or **Company** ASX: **ERM**) is pleased to advise, as part of the TCMG (a wholly owned subsidiary of PAR) / ERM Northern Project Area (NPA) Joint Venture agreements, the Mineral Resource Estimate (MRE) for the White Devil deposit within the Tennant Creek Mineral Field (TCMF), Northern Territory (Figure 1) has been updated.

## ASX Announcement

The Mineral Resources are reported on a 100% basis and in accordance with the JV agreements it is clear that White Devil is a Major Mine Deposit<sup>1</sup>.

Any major discovery or extension to an existing mine, with a Scoping Study containing >250,000oz of gold, as White Devil does, will be treated as a separate Major Mine Joint Venture (MMJV). Emmerson can elect to either maintain its equity position in the project by contributing 25% or be free carried at 10% to completion of a Definitive Feasibility Study (DFS). Additionally, while ERM is contributing, ERM has the ability to claw back 15% and reestablish its interest at 40% in the Major Mine, subject to several clawback provisions. Emmerson has already informed Tennant Mining of its intention to contribute to ongoing activities at White Devil and will exercise its claw back rights. As a result, the Company will retain a 40% contributing interest in the White Devil Project.

TCMG has recently met the earn in commitments for the NPA, as a result the NPA Joint Venture resulting in a 75% TCMG / 25% ERM Exploration Joint Venture has been formed.

The White Devil MRE (reported on a 100% basis) now totals **4.71Mt @ 4.1 g/t gold for 616,200oz** of contained gold including **4.0Mt @ 4.3 g/t gold for 549,100oz** (89%) in the Indicated Resource category, providing the foundation for feasibility studies which have commenced (Table 1 and Figures 2 to 4).

Given the results of the July White Devil Scoping Study (see ASX announcement dated 23 July 2025), the open pit resource has been redefined as material within the \$A\$4,000 pit shell. This change has resulted in a material increase to the Open Pit MRE, with the new open pit resource of **2.7Mt @ 4.7 g/t gold for 404,400 ounces of contained gold**, with 98.4% of the open pit MRE classified as Indicated (an increase from 1.1Mt @ 2.7 g/t gold for 117,000 ounces of contained gold).

Importantly while the overall increase in the MRE is modest at 4,800 ounces, the recent RC shallow drilling to the west has resulted in an increase of 18,600 ounces of Indicated Resources (partly by resource growth, but predominately through conversion of previously Inferred Resources to Indicated). This improvement in classification is expected to significantly improve the economics of the early stages of any development and allow a significant amount of the Open Pit MRE to convert to Probable Ore Reserves once the current Feasibility Study is completed.

The updated White Devil MRE incorporates all the results from recent drilling that was not available in April 2025 and results from the July scoping study.

**Table 1: White Devil Mineral Resource Estimate (100% basis) by Classification November 2025**  
(Open Pit - 0.5g/t Au within scoping study pit shell & Underground - 1.0g/t Au cutoff outside scoping study pit shell)

Resource Area	Cutoff	Indicated Resources			Inferred Resources			Total Resources		
		Tonnes (Kt)	Gold Grade (g/t)	Ounces	Tonnes (Kt)	Gold Grade (g/t)	Ounces	Tonnes (Kt)	Gold Grade (g/t)	Ounces
Open Pit Resource	0.5g/t	2,630	4.7	397,800	70	2.9	6,600	2,700	4.7	404,400
Underground Resource	1.0g/t	1,376	3.4	151,300	634	3.0	60,500	2,010	3.3	211,800
<b>Total</b>		<b>4,006</b>	<b>4.3</b>	<b>549,100</b>	<b>704</b>	<b>3.0</b>	<b>67,100</b>	<b>4,710</b>	<b>4.1</b>	<b>616,200</b>

*Note: Inconsistencies in total tonnage and ounces reporting are due to rounding. No Measured Resources Reported*  
White Devil is reported on a 100% basis, the project is currently in the Exploration Joint Venture 75% Tennant Mining, 25% ERM, however ultimate ownership structure in a Major Mine Joint Venture is expected to be 60% Tennant Mining, 40% ERM.

<sup>1</sup> See Emmerson Resources ASX announcement 16 November 2020 titled: *New Tennant Creek Strategic Alliance to Drive Aggressive Exploration, Production and Royalty Streams for details*

## ASX Announcement

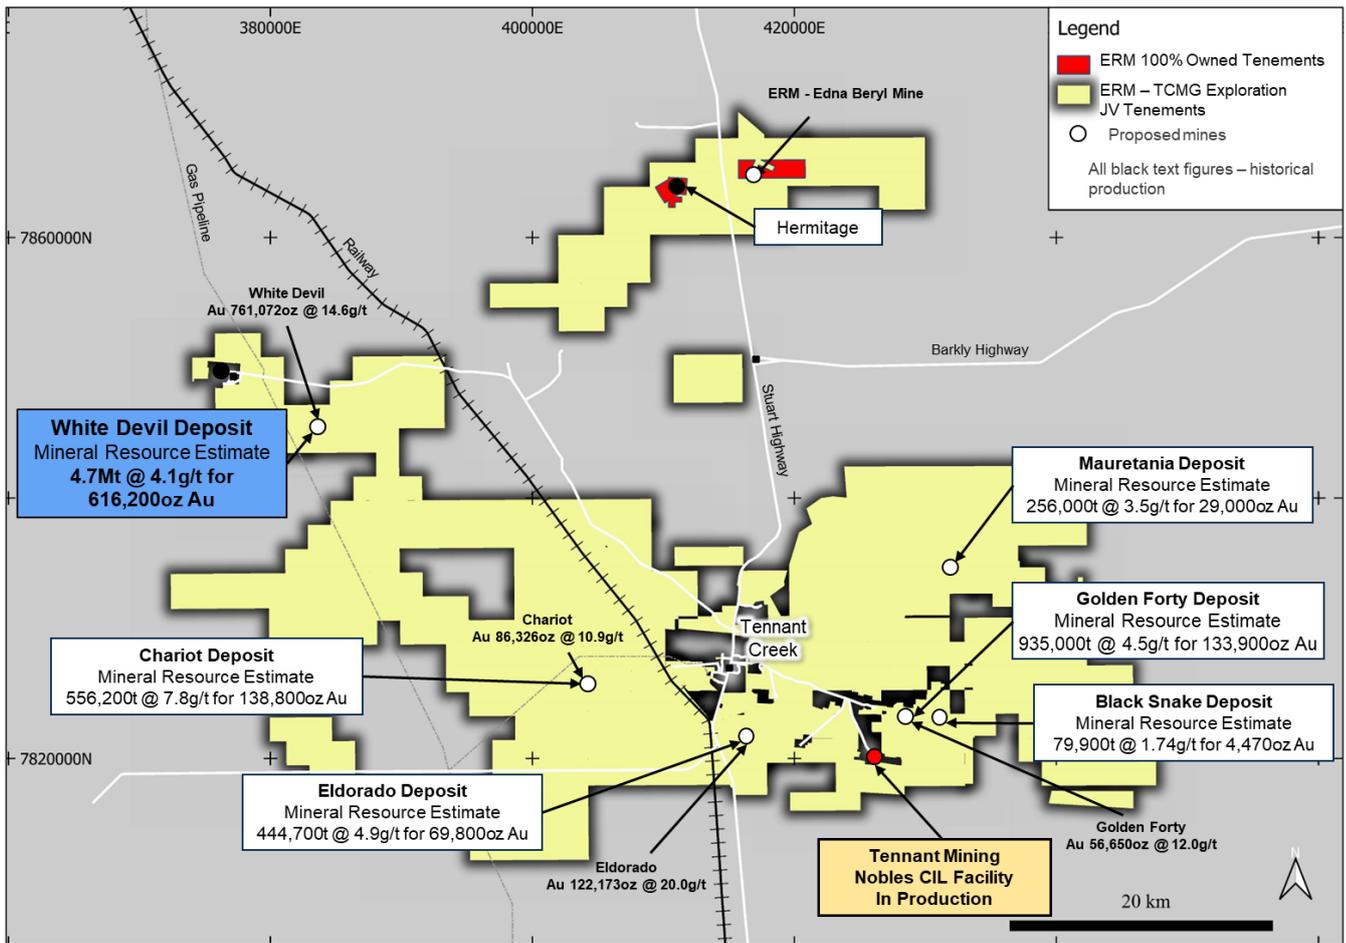

For comparison the previous MRE (April 2025) and the updated November MRE reported using the previous resource methodology is included in Table 2.

Importantly the Global Mineral Resource base in the TCMF has increased to **7.0Mt @ 4.4g/t gold for 992,200oz of contained gold**, including **5.61Mt @ 4.8g/t gold for 861,000oz of gold** (87%) classified as Indicated (see Table 3).

**Table 2:** Previous White Devil Mineral Resource Estimate by Classification April 2025 and November 2025 resource reported using previous parameters of Open Pit MRE - 0.5g/t Au cutoff surface to 130m & Underground - 1.0g/t Au cutoff below 130m from surface.

	Resource Area	Cutoff	Indicated Resources			Inferred Resources			Total Resources		
			Tonnes (Kt)	Gold Grade (g/t)	Ounces	Tonnes (Kt)	Gold Grade (g/t)	Ounces	Tonnes (Kt)	Gold Grade (g/t)	Ounces
April 2025 MRE	Open Pit Resource	0.5g/t	1,100	2.7	95,400	220	3.0	21,600	1,330	2.7	117,000
	Underground Resource	1.0g/t	2,650	5.1	435,100	590	3.1	59,300	3,240	4.7	494,400
	<b>Total</b>		<b>3,750</b>	<b>4.4</b>	<b>530,500</b>	<b>820</b>	<b>3.1</b>	<b>80,860</b>	<b>4,570</b>	<b>4.2</b>	<b>611,400</b>
November 2025 MRE (using previous parameters)	Open Pit Resource	0.5g/t	1,290	2.7	110,800	111	1.7	5,900	1,401	2.6	116,700
	Underground Resource	1.0g/t	2,663	5.1	436,900	590	3.1	59,300	3,276	4.7	498,700
	<b>Total</b>		<b>3,750</b>	<b>4.4</b>	<b>547,700</b>	<b>724</b>	<b>2.9</b>	<b>67,700</b>	<b>4,677</b>	<b>4.1</b>	<b>615,400</b>

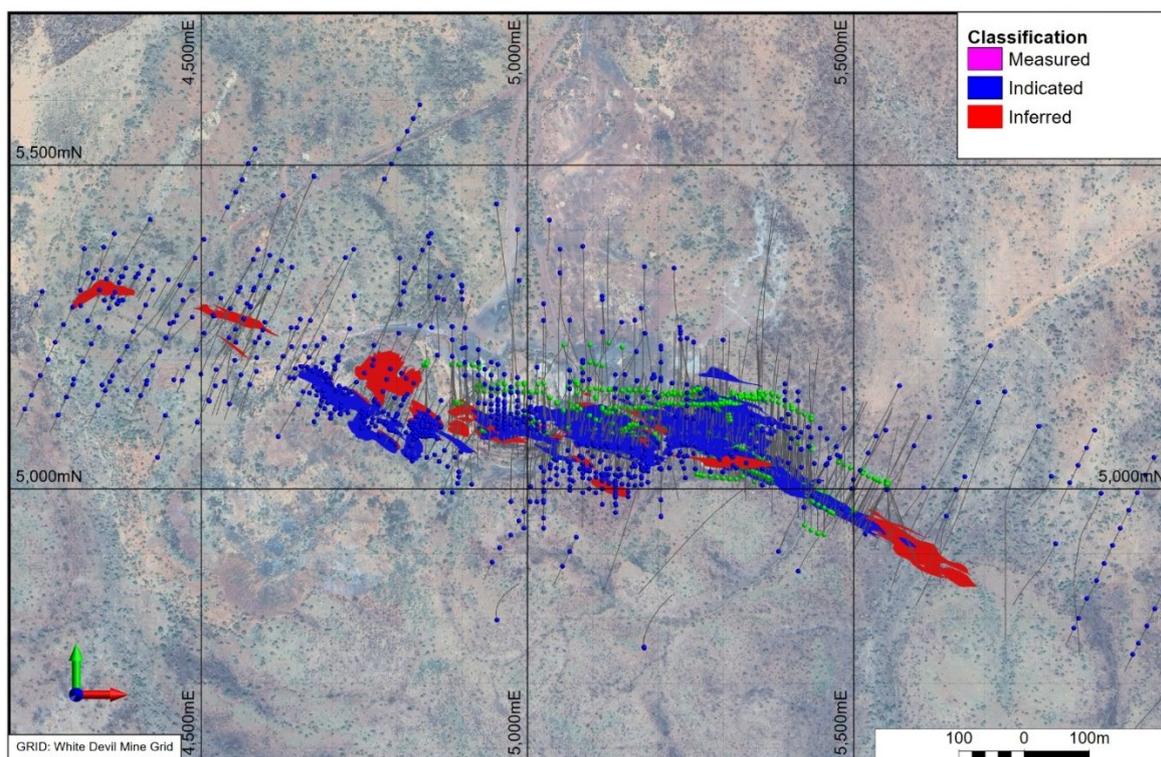

*Note: Inconsistencies in total tonnage and ounces reporting are due to rounding. No Measured Resources Reported*

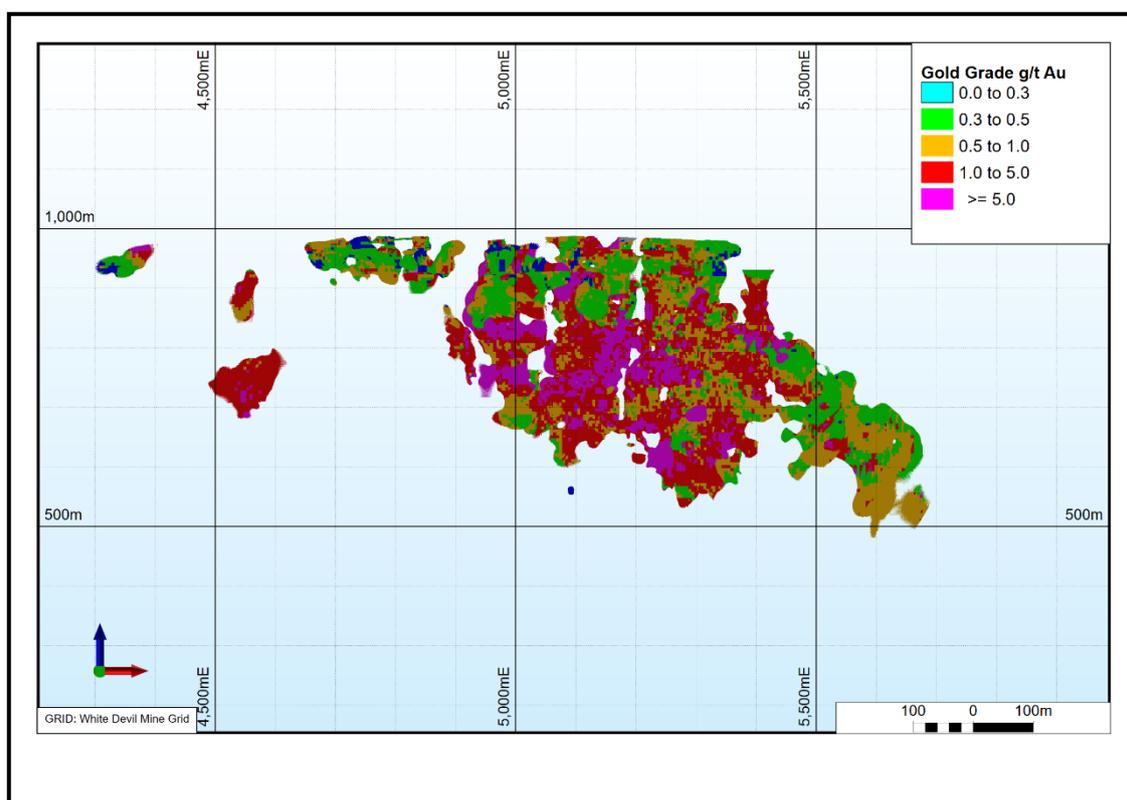

**Figure 1:** Emmerson's Tennant Creek Project highlighting the White Devil MRE showing the location of Emmerson's Mineral Resources, the area covered by the Exploration JV and Emmerson's 100% owned projects (White call out boxes are SMJV deposits which are 100% controlled by TCMG, with ERM receiving a 6% Gross Production Royalty)

Note: Quoted production from major historical deposits after Ahmad, M. and Munson, T.J. (2013). Geology and mineral resources of the Northern Territory, Special Publication 5, For Chariot mine and Malbec West mine, quoted production from Giants Reef Mill Reconciled Production to end of month September 2005 (Giants Reef internal reporting).

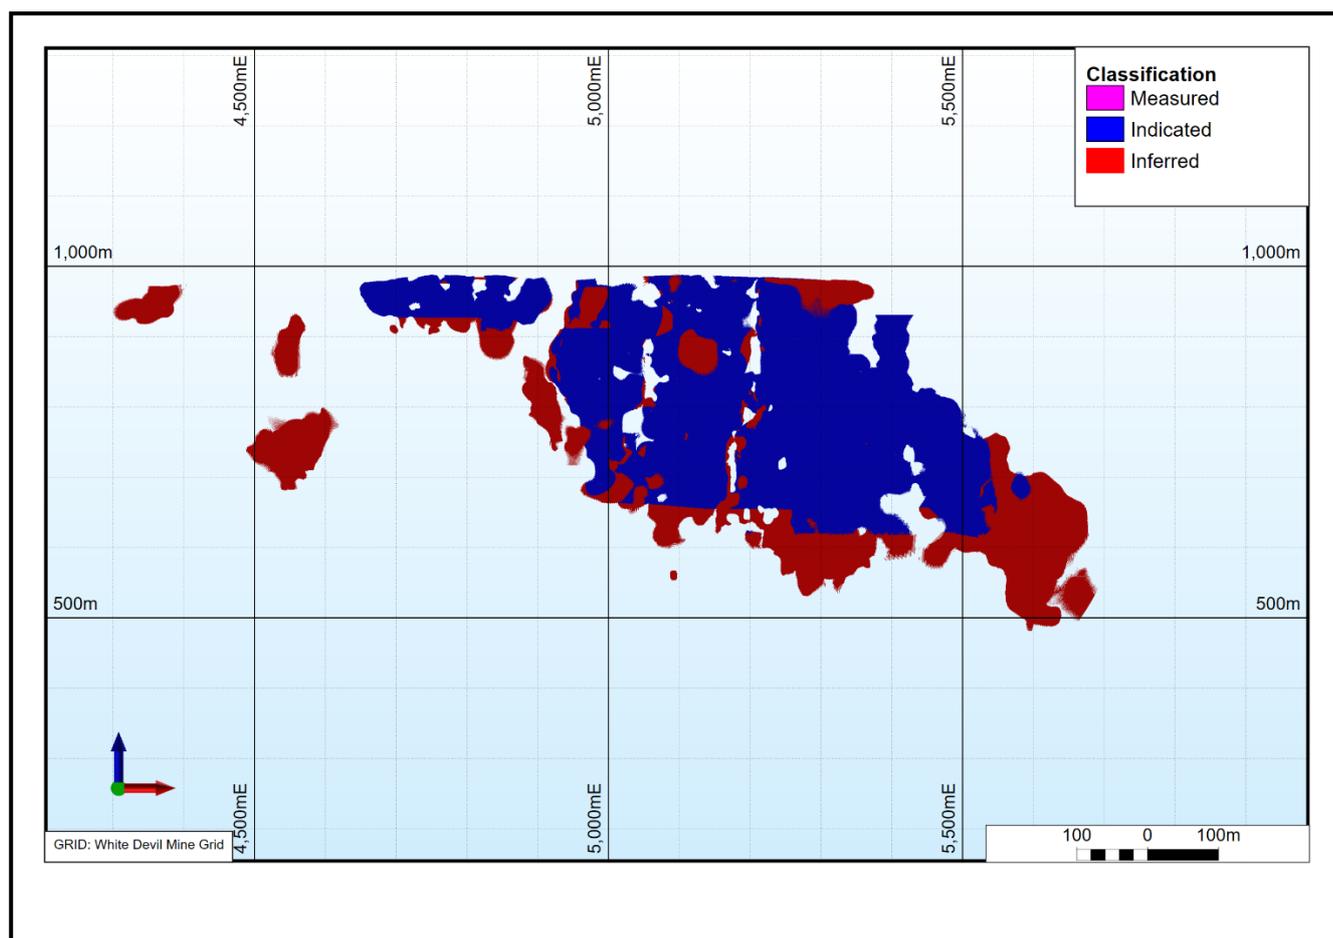

The updated mineral resource estimate was completed by independent consultant Mr Stephen Rose of Rose Mining Geology who was engaged by Emmerson to complete the MRE on the White Devil Deposit in accordance with the JORC 2012 code.

**Figure 2:** White Devil Drill Hole Collar Plan with block model coloured by Resource classification (Red Indicated, Blue Inferred). Drill hole collars coloured by Surface (blue dots at the collar position) and Underground (green dots at the collar position)

**Figure 3:** Long section of the White Devil Block Model (looking North) coloured by gold grade.

**Figure 4:** Long section of the White Devil Block Model (looking North) coloured by Resource Classification (Red blocks Indicated, Blue Inferred).

A summary of JORC Table 1 is provided below in line with requirements of ASX listing rule 5.8.1.

## Geology

The White Devil Project is located 43 kilometres north-northwest of the Tennant Creek township.

Tennant Creek Au-Cu-Bi mineralisation is typically hosted in hematite-magnetite-quartz-jasper ironstones within the Lower Proterozoic Warramunga Formation.

Locally the Warramunga Formation consists of interbedded greywacke, sandstone and shale, weathered at the surface to a deep red to orange colour. Below the oxidised zone, the sediments are pale green to grey-green in colour. Bedding thickness varies from a fine parallel lamination in shale (1 to 5 mm), to thick, massively bedded sandstone and greywacke (0.5 to 3 m). Cutting through the sediments are two structural corridors, both are characterised by strong chlorite alteration, which is oxidised to haematite in the 100 or so metres below the surface. Chlorite alteration is gradational from the surrounding sediments, peaking towards the centre of the structures. Bodies of hematite ± magnetite ± quartz, locally termed ironstones, are located in both structures.

Cutting through the sediments are a number of quartz + feldspar porphyries. The porphyries are characterised by a quartz + feldspar groundmass with quartz “eyes” typically between 0.5cm to 1.0cm long. Larger feldspar crystals are common with sizes from 1.0cm to 2.0cm. Quartz veins are also common, trending roughly east-west and steeply dipping.

## ASX Announcement

The geological interpretation of the deposit is based on detailed logging and sampling combined with a 3D model of the lithology domains. The high-density reverse circulation (RC) and surface and underground diamond drilling (DDH) throughout the deposit has supported the development of this geological model plus a robust understanding of the distribution of mineralisation.

White Devil is situated in a northwest trending structural corridor. The gold-bearing ironstone bodies at White Devil strike NW-SE, are steeply dipping with high grade lodes plunging northwest within the overall ironstone units. There is an apparent overall easterly plunge, however this apparent easterly plunge could be as a result of the data density and location of drill data. White Devil produced 761,072oz of gold at a head grade of 14.6g/t gold from 1987 to mid-1999. Mining ceased as a result of the low gold price at this time and not due to depletion of the deposit.

**Table 3: Tennant Creek Project JORC 2012 Mineral Resource Details**  
(SMJV Projects 100% controlled by Tennant mining with ERM receiving a 6% Gross Production Royalty, Exploration JV projects are 75% Tennant Mining, 25% ERM until development decision)

Deposit	Indicated Resources			Inferred Resources			Total Resources		
	Tonnes (Kt)	Gold Grade (g/t)	Ounces	Tonnes (Kt)	Gold Grade (g/t)	Ounces	Tonnes (Kt)	Gold Grade (g/t)	Ounces
<b>Mauretania (SMJV)</b>	159.3	4.8	25,000	97	1.4	4,000	256	3.5	29,000
<b>Chariot (SMJV)</b>	409.1	8.7	114,600	147.1	5.1	24,200	556.2	7.8	138,800
<b>Black Snake (SMJV)</b>	50.9	2.1	3,500	29	1.1	1,000	79.9	1.7	4,500
<b>Golden Forty (SMJV)</b>	706	5	113,200	228.7	2.8	20,700	935	4.5	133,900
<b>Eldorado*</b>	277.5	6.2	55,600	167.2	2.6	14,200	444.7	4.9	69,800
<b>White Devil*</b>	4,006	4.3	549,100	704	3.0	67,100	4,710	4.1	616,200
<b>Total</b>	<b>5,610</b>	<b>4.8</b>	<b>861,000</b>	<b>1,400</b>	<b>3.0</b>	<b>131,200</b>	<b>7,000</b>	<b>4.4</b>	<b>992,200</b>

**Notes:** Inconsistencies in the table above are due to rounding.  
Mauretania Open Pit (OP) as reported 6 April 2022 using a 0.5g/t gold cut-off grade and above the 190mRL (within 140m of surface).  
Chariot Open Pit (OP) is as reported 2 December 2021, using a 1.0 g/t cutoff & Chariot Underground is as reported 2 December 2021, using a 2.0 g/t cutoff and reported below a 180mRL have been combined in Table 2 above.  
Black Snake Open Pit Resource reported 19 March 2024, using a 0.5 g/t cutoff  
Golden Forty Resource reported 6 May 2024 using a 0.5g/t cut-off.  
Eldorado Resource reported 12 June 2024 using a 0.5g/t cut-off for shallow portion and 1.0g/t at depth  
White Devil Resource (in this report) using 0.5g/t cut-off within the Scoping Study open pit shell and 1.0g/t at depth  
SMJV Deposits held in Small Mines JV where TCMG / PAR are managers and 100% owners and ERM receive a 6% gross production royalty on precious metals.  
\* Deposits held in Exploration JV until development studies completed. Deposits >250Koz may be subject to JV approval, transferred to a Major Mine JV (75% PAR / 25% ERM contributing with ERM retaining claw back rights to 40% subject to a number of provisions of the agreements), Deposits <250Koz progress to the SMJV, where PAR gain 100% control and ERM receives a 6% gross production royalty once development studies are completed.

## ASX Announcement

---

### Drilling Techniques

A combination of underground and surface diamond, reverse circulation, percussion, vacuum and RAB rigs were used by Australian Development Limited (ADL) and Normandy (and subsidiary or related companies Poseidon Gold, and Geopeko).

ADL drilling utilised percussion, diamond drilling and to a lesser extent RC, with all holes collared from surface.

During the mining period (1987 – Mid 1999), under Normandy, the drilling was RC and a combination of surface and underground diamond drilling.

Emmerson completed 40 surface RC holes for 3,929m in late 2024 and early 2025 to the east of the historical open pit and a further 50 RC holes for 4,800m west of the historical open pit in mid 2025.

The White Devil database contains data for 2,981 drill holes with approximately 195,990 metres of diamond and RC drilling sampled.

### Sampling and Sub-sampling techniques

The Company has a detailed library of hard copy historical records dating back to the 1960s which outline the drilling techniques, geological data and analytical information for the deposit.

During the mining period where most of the RC and Diamond drilling occurred (1986-99 under Normandy), standard methodology was used by the majority of exploration and mining companies. In brief the 3m composite samples were collected for the RC holes, reduced to 1m samples for intervals within the altered zones and ironstones. Diamond drilling sampling was again standard cutting to half core with half being retained and the sampled half being assayed.

There is an extensive core storage facility on site at White Devil, where the majority of the diamond core is stored.

### Sample Analysis Method

Normandy RC samples were routinely assayed for Au, Bi, Cu, Fe, Pb and Zn using the ALS laboratory. Analysis for gold was carried out by fire assay using a 50g charge, and then Atomic Absorption Spectroscopy (AAS). The suite of base metal elements were assayed by acid digest and AAS finish. Procedures developed for assay quality control with field duplication and blanks were also inserted.

Underground diamond drillholes were assayed at the Normandy site laboratory at Warrego. Although this was a company site laboratory, there was a procedure so it took part in round-robin assaying with a group of commercial laboratories, with the results reporting on roughly quarterly basis.

These historical assays were entered from historical reports and the existing Normandy digital database into the Emmerson database as part of data compilation and for estimation work purposes. Random checks of historical records against results contained within the database has been undertaken. No material variances were identified in the validation process.

The Emmerson drilling were assayed by AR10/MS method for Au, Ag, Bi, Co, Cu, Fe and S by aqua regia acid and an Inductive Coupled Plasma Mass Spectrometry (ICPMS) finish. Gold grades >2,000ppb were re-assayed using fire assay fusion and analysed for gold content by an ICPOES finish

### Mineral Resource Classification

The Mineral Resource has been constrained to a maximum vertical depth of 500m below surface, reflecting the depth coverage of drilling. The Mineral Resource has been classified as Indicated and Inferred based on drill hole spacing, geological continuity, estimation quality parameters and confidence in the void model.

The Indicated Mineral Resource is supported by drilling with nominal 10-20m x 10-20m spacing and predominately informed by the first and second estimation pass. Geological continuity is demonstrated by the geological interpretation from drilling and mapping from underground development.

The Inferred Mineral Resource was defined where there was a low to moderate level of geological confidence in geometry, there was still continuity of grade, and drill spacing was greater than 20m, where there was some doubt about the void model or if the mineralisation wireframe was small. Inferred blocks are informed by the first, second and third estimation pass. Geological continuity is demonstrated by the geological interpretation from

## ASX Announcement

drilling. Mineralisation hosted within quartz-porphry dykes has been classified as Inferred, on the basis that the continuity is lower.

Unclassified mineralisation has not been reported in this Mineral Resource. This is the material that is unsupported by geology and drilling or zones that are considered to be too sparsely drill tested to confirm continuity of grade or geology, or where there is doubt about the void model.

### Estimation Methodology

Lithology wireframes and surfaces were modelled using conventional strings and wireframes using Micromine software. The mineralised wireframes were modelled by vein modelling tools using Micromine software. The ironstone was used as a guide for the gold mineralisation constraining wireframes. Quartz-porphry dykes were generally used as limits to gold mineralisation (although in certain locations there was some limited mineralisation hosted within quartz-porphry dyke). Mineralisation was modelled an approximate 0.3g/t Au cut-off. Internal high grade (approx. >10g/t Au) sub-domains were modelled and estimated separately. All wireframe solids were snapped to drillholes.

Drillhole intercepts were composited downhole to 1m lengths within the interpreted mineralisation wireframes. Only samples from RC and diamond holes were composited. Any unsampled intervals were assigned a grade equivalent to half detection limit. Gold estimation was carried out using ordinary kriging (OK), with hard boundaries between the domains. The search ellipsoids followed the vein reference plane to improve local estimation efficiency. Caps (top-cuts) were applied to the composites prior to estimation to reduce the influence of outliers. The specific caps vary depending on the mineralisation wireframe, host rock and weathering domain, In the oxide domain non-ironstone samples were capped at 13g/t Au, whilst ironstone hosted samples were capped at 36g/t Au; within the transitional domain non-ironstone hosted samples were capped at 15g/t Au, whilst ironstone hosted samples were capped at 145g/t Au; with the fresh domain non-ironstone samples were capped at between 1g/t Au and 50g/t Au depending on the mineralisation wireframe, whilst ironstone hosted samples were capped at between 7 to 175g/t Au depending on the mineralisation wireframe. High-grade domains were capped at 500g/t Au. Gold variography was undertaken on domains that had sufficient samples to give reliable charts. The nugget was approximately 20% to 30%, depending on domain. Maximum ranges of between 12m and 50m were applied. Three search passes were used, with increasing search distances and decreasing minimum sample numbers employed.

Bulk density (SG) was assigned to the block model based on weathering type and lithology. The applied density values were derived from density undertaken on the diamond drill core using the water immersion method. The data came from diamond drillholes drilled by Normandy.

### Cut-off Grades

For reporting, a cut-off grade above 0.5g/t gold for the portion of the resource that falls within the conceptual pit optimisation as defined in the July 2025 scoping study and 1.0g/t for the deeper portions of the deposit. The choice of cut-off grade is based on a gold price of A\$4,000/oz, metallurgical recovery of 90%, royalties (third parties and government royalties), and mining and milling costs using values from recent evaluation studies of nearby deposits and the White Devil Scoping Study, completed in July 2025.

### Mining and Metallurgical Methods Parameters

A conventional open pit has been assumed for the upper part of the deposit. The existing White Devil open pit demonstrates that open pitting is a viable mining option, with the pit remaining intact after being open since the 1980s. The deeper part of the deposit has the potential to be mined by conventional underground methods. There is an existing underground mine that was in successfully in operation for ten years. The MRE described here is within 200m of the old mine. When White Devil was in production, the ore was processed in a conventional CIL circuit at Warrego. The Company holds production records which catalogue the recoveries and rates. White Devil is approximately 50 km from the operating Nobles Gold Plant, which is owned by Emmerson's JV Partner Tennant Consolidated Mining Group (TCMG, a fully owned subsidiary of Pan African Resources). White Devil falls within the exploration JV between Emmerson and TCMG. Access to White Devil is via a 3.0km gravel road, and then onto the sealed Warrego Road. The route to Nobles Gold Plant is then via sealed roads. The deposit sits on a granted Mining Lease and has sacred site clearances in place. The JV between TCMG and Emmerson forms a framework that can allow production from White Devil and processing at the Nobles Gold Plant. The Competent Person

## ASX Announcement

therefore considers that there are Reasonable Prospects for Eventual Economic Extraction (RPEEE) as set out in Clause 20 of the JORC 2012 Code. This has been backed up by a scoping study on the project, which concluded that conceptually a robust project could be developed at White Devil (see ASX announcement dated 23 July for full details).

## Competency Statement

*The information in this announcement that relates to Mineral Resources is based on and fairly represents information compiled by Mr Steve Rose, Principal Mining Geologist with Rose Mining Geology – an Independent Geological Consultancy engaged by Emmerson Resources to undertake the Mineral Resource Estimate for White Devil. Mr Rose is a Fellow of the Australasian Institute of Mining and Metallurgy (AusIMM) and has sufficient experience of relevance to the styles of mineralisation and types of deposits under consideration, and to the activities undertaken to qualify as Competent Persons as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Rose consents to the inclusion in this announcement of the matters based on their information in the form and context in which they appear.*

*Information in this announcement that relates to Exploration Results, Mineral Resources and Ore Reserves has been extracted from the following Company ASX announcements:*

- ASX: 2 December 2021 – Chariot High Grade Gold Resource increased by 40%
- ASX: 6 April 2022 – High-Grade Gold Resource for Mauretania at Tennant Creek
- ASX: 19 March 2024 - Initial Ore Reserve for Chariot, Mauretania and Black Snake
- ASX: 6 May 2024 – Maiden High-grade Golden Forty Mineral Resource Estimate
- ASX: 12 June 2024 - Maiden High-grade Eldorado Mineral Resource Estimate
- ASX: 29 January 2025 – White Devil Expands Tennant Creek Mineral Resource to 866koz
- ASX: 15 April 2025 – White Devil Resource Grows by 25% to 611Koz
- ASX: 23 July 2025 – White Devil Scoping Study Confirms Major Mine JV Development Opportunity
- ASX: 4 September 2025 – Shallow High-Grade Gold Results Extend White Devil Deposit

*The Company confirms that it is not aware of any new information or data that materially affects the information that relates to Exploration Results, Mineral Resources or Ore Reserves included in previous market announcements. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.*

*The above announcements are available to view on the Company's website at [www.emmersonresources.com.au](http://www.emmersonresources.com.au)*

## ASX Announcement

### Regulatory Information

*The Company does not suggest that economic mineralisation is contained in the untested areas, the information contained relating to historical drilling records have been compiled, reviewed, and verified as best as the Company was able. As outlined in this announcement the Company is planning further drilling programs to understand the geology, structure, and potential of the untested areas. The Company cautions investors against using this announcement solely as a basis for investment decisions without regard for this disclaimer.*

### Cautionary Statement and Forward-Looking Statements

*This document may include forward-looking statements, opinions and projections, all preliminary in nature, prepared by the Company on the basis of information developed by itself in relation to its projects. Forward-looking statements include, but are not limited to, statements concerning Emmerson Resources Limited's anticipated future events, including future resources and exploration results, and other statements that are not historical facts. When used in this document, the words such as "could", "estimate", "plan," "expect," "intend," "may", "potential," "should," "believe", "anticipates", "predict", "goals", "targets", "aims", "outlook", "guidance", "forecasts", "may", "will", "would" or "should" or, in each case, their negative or other variations or similar expressions are forward-looking statements. By their nature, such statements involve known and unknown risks, assumptions, uncertainties, and other important factors, many of which are beyond the control of the Company, and which may cause actual results, performance, or achievements to differ materially from those expressed or implied by such statements.*

*Forward-looking statements speak only as at the date of this document and the Company does not undertake any obligation to update forward-looking statements even if circumstances or management's estimates or opinions should change. Forward-looking statements are provided as a general guide only and should not be relied on as an indication or guarantee of future performance. No representation is made that any of these statements or projections will come to pass or that any forecast result will be achieved, nor as to their accuracy, completeness or correctness. Similarly, no representation is given that the assumptions upon which forward looking statements may be based are reasonable. Given these uncertainties, investors should not place undue reliance on forward-looking statements. The Company cautions investors against using this announcement solely as a basis for investment decisions without regard for this disclaimer.*

## About Emmerson Resources

### Tennant Creek

Emmerson has a commanding land position and is exploring the Tennant Creek Mineral Field (TCMF), one of Australia's highest-grade gold and copper fields that has produced over 5.5Moz of gold and 470,000t of copper from deposits including Warrego, White Devil, Orlando, Gecko, Chariot, and Golden Forty. These high-grade deposits are highly valuable exploration targets, and to date, Emmerson's discoveries include high-grade gold at Edna Beryl and Mauretania, plus copper-gold at Goanna and Monitor and these were found utilising new technology and concepts and are the first discoveries in the TCMF for over two decades. The rush of new tenement applications by major and junior explorers in the Tennant Creek district, not only highlights the prospectivity of the region for copper and gold but also Emmerson's strategic ~1,800km<sup>2</sup> land holding.

### New South Wales

Emmerson is actively exploring two early-stage gold-copper projects in NSW, identified from the application of 2D and 3D predictive targeting models. The highly prospective Macquarie Arc in NSW hosts >80Moz gold and >13Mt copper with these resources heavily weighted to areas of outcrop or limited cover. Emmerson's exploration projects contain many attributes of the known deposits within the Macquarie Arc but remain underexplored due to historical impediments, including overlying cover (farmlands and younger rocks) and a lack of effective historic exploration.

ASX Announcement

Appendix 1: JORC Table 1

The exploration results contained within the above company release are in accordance with the guidelines of The Australasian Code for the Reporting of Exploration Results, Mineral Resources and Ore Reserves (the JORC Code, 2012)

Section 1: Sampling Techniques and Data – White Devil Project Area

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code Explanation	Commentary																															
Sampling techniques	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (e.g., 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g., submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<p>The prospect has been drilled and sampled using mostly surface and underground diamond drilling and surface RC (see below)</p> <table border="1"> <thead> <tr> <th>COMPANY</th> <th>Hole Type</th> <th>Depth</th> </tr> </thead> <tbody> <tr> <td rowspan="5">ADL (1980 to 1986)</td> <td>Diamond</td> <td>4,515</td> </tr> <tr> <td>Percussion</td> <td>1,949</td> </tr> <tr> <td>RC</td> <td>18,259</td> </tr> <tr> <td>RC/ DD</td> <td>1,023</td> </tr> <tr> <td><b>Subtotal</b></td> <td><b>25,745</b></td> </tr> <tr> <td rowspan="7">NORMANDY (1986 until 1999)</td> <td>Diamond</td> <td>113,771</td> </tr> <tr> <td>Perc/Diamond</td> <td>1,237</td> </tr> <tr> <td>Percussion</td> <td>49</td> </tr> <tr> <td>RAB</td> <td>8,767</td> </tr> <tr> <td>RC</td> <td>24,450</td> </tr> <tr> <td>Sludge</td> <td>13,563</td> </tr> <tr> <td><b>Subtotal</b></td> <td><b>161,837</b></td> </tr> <tr> <td><b>Total</b></td> <td><b>187,582</b></td> </tr> </tbody> </table> <p>Emmerson completed a further 90 RC drillholes for a total of 8,728m of RC in late 2024 and early to mid-2025</p> <p>Drillholes were drilled to sample across the mineralisation as close to perpendicular as possible.</p> <p>Samples were either collected on 1 m spacing or broken at lithology boundaries.</p> <p>RC chips were riffle split on site to obtain 3 m composites and 1 m individual samples from which 2.5 – 3.0kg was pulverised (at Genalysis in Alice Springs or at the Peko lab at Warrego) to produce a 25g charge for analysis by Aqua Regia Digest/ICP-OE and 4 Acid digest for copper and base metals.</p>	COMPANY	Hole Type	Depth	ADL (1980 to 1986)	Diamond	4,515	Percussion	1,949	RC	18,259	RC/ DD	1,023	<b>Subtotal</b>	<b>25,745</b>	NORMANDY (1986 until 1999)	Diamond	113,771	Perc/Diamond	1,237	Percussion	49	RAB	8,767	RC	24,450	Sludge	13,563	<b>Subtotal</b>	<b>161,837</b>	<b>Total</b>	<b>187,582</b>

### Section 3: Estimation and Reporting of Mineral Resources – White Devil

(Criteria listed in section 1, and where relevant in sections 2, also apply to this section.)

Criteria	JORC Code Explanation	Commentary
Database integrity	<ul style="list-style-type: none"> <li>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</li> </ul>	<ul style="list-style-type: none"> <li>All historical ADL and Normandy data for the White Devil deposit was uploaded into ERM's DataShed database after ERM acquired the project. ERM undertook an intensive validation programme going through all of the historical hardcopy logs and original assay reports as part of the Resource estimation process. No material errors were identified.</li> <li>Routine database checks are conducted by ERM's consultant Database Manager.</li> <li>All data has been validated by ERM geologists prior to inclusion in the resource estimate.</li> <li>Personnel access to the DataShed database is restricted to preserve the security of the data.</li> </ul>
	<ul style="list-style-type: none"> <li>Data validation procedures used.</li> </ul>	<ul style="list-style-type: none"> <li>A period of detailed database validation was carried out by ERM geologists. The validation was updated in the DataShed database and extracted into specialist software to validate in 3D. Random check validation has also been undertaken on the historical hardcopy data.</li> </ul>
Site visits	<ul style="list-style-type: none"> <li>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</li> </ul>	<ul style="list-style-type: none"> <li>Several site visits have been completed by Competent Person Steve Rose. These visits support the geological and mineralisation models, and the sampling that has been carried out.</li> </ul>
	<ul style="list-style-type: none"> <li>If no site visits have been undertaken indicate why this is the case.</li> </ul>	N/A
Geological interpretation	<ul style="list-style-type: none"> <li>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</li> </ul>	<ul style="list-style-type: none"> <li>The high density of RC and Diamond drilling throughout the deposit and underground mining has supported the development of a robust geological model and understanding of the mineralisation distribution. The geological interpretation of the deposit is supported by underground sampling of the host units which have been interpreted into a 3D model of the lithology domains.</li> <li>The host rocks are generally well defined in the logged lithology records. Geological continuity is demonstrated by the detailed underground diamond drilling and the historical underground mining.</li> </ul>
	<ul style="list-style-type: none"> <li>Nature of the data used and of any assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>Data is stored in a master DataShed database. Exports were in Microsoft Access and Excel formats for import to modelling software. No assumptions were made or applied to the data.</li> <li>The data is considered to be robust due to effective database management, and validation checks to verify the quality. Original data and survey records are utilised to validate any identified issues.</li> </ul>
	<ul style="list-style-type: none"> <li>The effect, if any, of alternative interpretations on Mineral Resource estimation.</li> </ul>	<ul style="list-style-type: none"> <li>The presence of extensive exposure to the mineralisation through the open pit and underground workings precludes materially different interpretations.</li> </ul>
	<ul style="list-style-type: none"> <li>The use of geology in guiding and controlling Mineral Resource estimation.</li> </ul>	<ul style="list-style-type: none"> <li>The gold grade is dominantly within the ironstone lithological unit with a very minor amount hosted within or proximal to the cross cutting porphyry units. All geological observations were used to guide the interpretation and further control the trends of the Mineral Resource estimate.</li> </ul>

ASX Announcement

Criteria	JORC Code Explanation	Commentary																																			
	<ul style="list-style-type: none"> <li>The factors affecting continuity both of grade and geology.</li> </ul>	<ul style="list-style-type: none"> <li>Gold mineralisation at White Devil occurs as an east-west striking, steeply south dipping ironstone body.</li> <li>There are several ironstone bodies present at White Devil. These bodies have been faulted and brecciated, consequently creating zones of gold deposition.</li> <li>The gold-bearing units are typically hosted by magnetite-haematite-rich ironstone unit with localised zones of talc-magnetite and quartz-magnetite lithologies. Some mineralisation is present within the chloritised halo surrounding the ironstone.</li> <li>Fault modelling has also been used to assist with mineralisation interpretation.</li> <li>The mineralisation is dissected by several post-mineralisation porphyry dykes. There is little displacement on these dykes other than dilation</li> </ul>																																			
Dimensions	<ul style="list-style-type: none"> <li>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource</li> </ul>	<ul style="list-style-type: none"> <li>The White Devil deposit Mineral Resource has an approximate strike length of 1,400m.</li> <li>The plan width of mineralised zones in the model ranges from 3 m to 30m, with a current depth range of from surface to 500m below surface.</li> </ul>																																			
Estimation and modelling techniques	<ul style="list-style-type: none"> <li>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points.
