

## **Murchison Gold Mineral Resource Grows 44% to +1.1 Million Ounces**

### **Highlights:**

- Global Mineral Resource for Latitude’s Murchison Gold Project grows to 13.1Mt @ 2.6.g/t Au for 1,115,000 ounces following 125% increase in Turnberry Mineral Resource to 610,000oz gold
- Independent technical experts CSA Global were appointed to conduct a fatal flaw review of the Mineral Resource estimate prior to public release, no fatal flaws identified
- The high confidence Indicated classification accounts for 64% of the open pit constrained Turnberry Mineral Resource and 58% of the total Turnberry Mineral Resource
- Turnberry has a current strike length of 1.5km and remains open to the north, south and at depth
- The Turnberry Mineral Resource averages 1,850 ounces per vertical metre from surface to a depth of 200m where the density of drilling reduces significantly
- 27 new lodes defined within the mineralised zone at Turnberry following a detailed review and audit of the project drill hole database
- Turnberry is shallow and has never been mined by open pit or underground
- 64,736m of drilling used as the basis for the Turnberry Mineral Resource update, including 3,887m of diamond drilling and 60,849m of RC drilling
- Initial assay results from the current 10,000m drilling campaign are expected in early June with results from drilling specifically targeting the 5.5km Turnberry – St Anne’s corridor expected in July

---

Latitude Consolidated Limited (ASX:LCD) (“**Latitude**” or “**the Company**”) is pleased to announce that it has grown its total Mineral Resource to **1,115,000 ounces (13.1Mt @ 2.6.g/t gold)** following a 125% increase to the Mineral Resource estimate for the Turnberry deposit (“**Turnberry**”) which now stands at 610,000 ounces (11.3Mt @ 1.7 g/t gold).

Turnberry forms a key part of the Company’s broader Murchison Gold Project, which covers 343km<sup>2</sup> in the Murchison Goldfields in Western Australia. This is the first Mineral Resource update to be completed since May 2019 when it was considered a non-core asset by previous owner Silver Lake Resources Limited (ASX:SLR).

A review of the documents relating to the historical Mineral Resource estimate for Turnberry show that previous modelling of the resource was performed in a manner so as to produce a low tonnage, high grade estimate that could be processed by the low throughput Andy Well mill. Although this approach was strategically valid and also reflective of the gold price environment at the time, it resulted in a large number of mineralised intersections present in drilling being left out of the historical Mineral Resource estimates.

In total the historical Mineral Resource estimate for Turnberry contained only 16 discrete lodes. This update captures all mineralisation present in drill holes resulting in a total of 43 discrete lodes forming the updated Turnberry Mineral Resource.

Importantly, Turnberry remains open at depth, and to the north and south within a broad 5.5km trend of gold anomalism evident in drilling and associated with a similarly geological package and magnetic anomaly.

**Commenting on this result, CEO Tim Davidson said:** *“We continue to build on our large, existing high grade gold resource and this 125% upgrade at Turnberry is a fantastic outcome for Latitude. In short order, we have been able to clearly demonstrate the true scale and growth potential of our high grade gold projects in the prolific Western Australian gold producing region of the Murchison.*

*Turnberry is a shallow, high grade deposit that has significant strike of 1.5km and remains open at depth and along strike. Given the scale of mineralisation at Turnberry the Company is increasingly excited by the St Anne’s prospect, which lies 3.5km to the south of Turnberry and displays similar grade and width characteristics to that seen at Turnberry in the limited drilling completed at the prospect to date.*

*We have a clear plan in place to grow the existing resource base through systematic drilling and with a suite of high grade gold targets outside of the existing resource base we are looking forward to delivering further success.”*

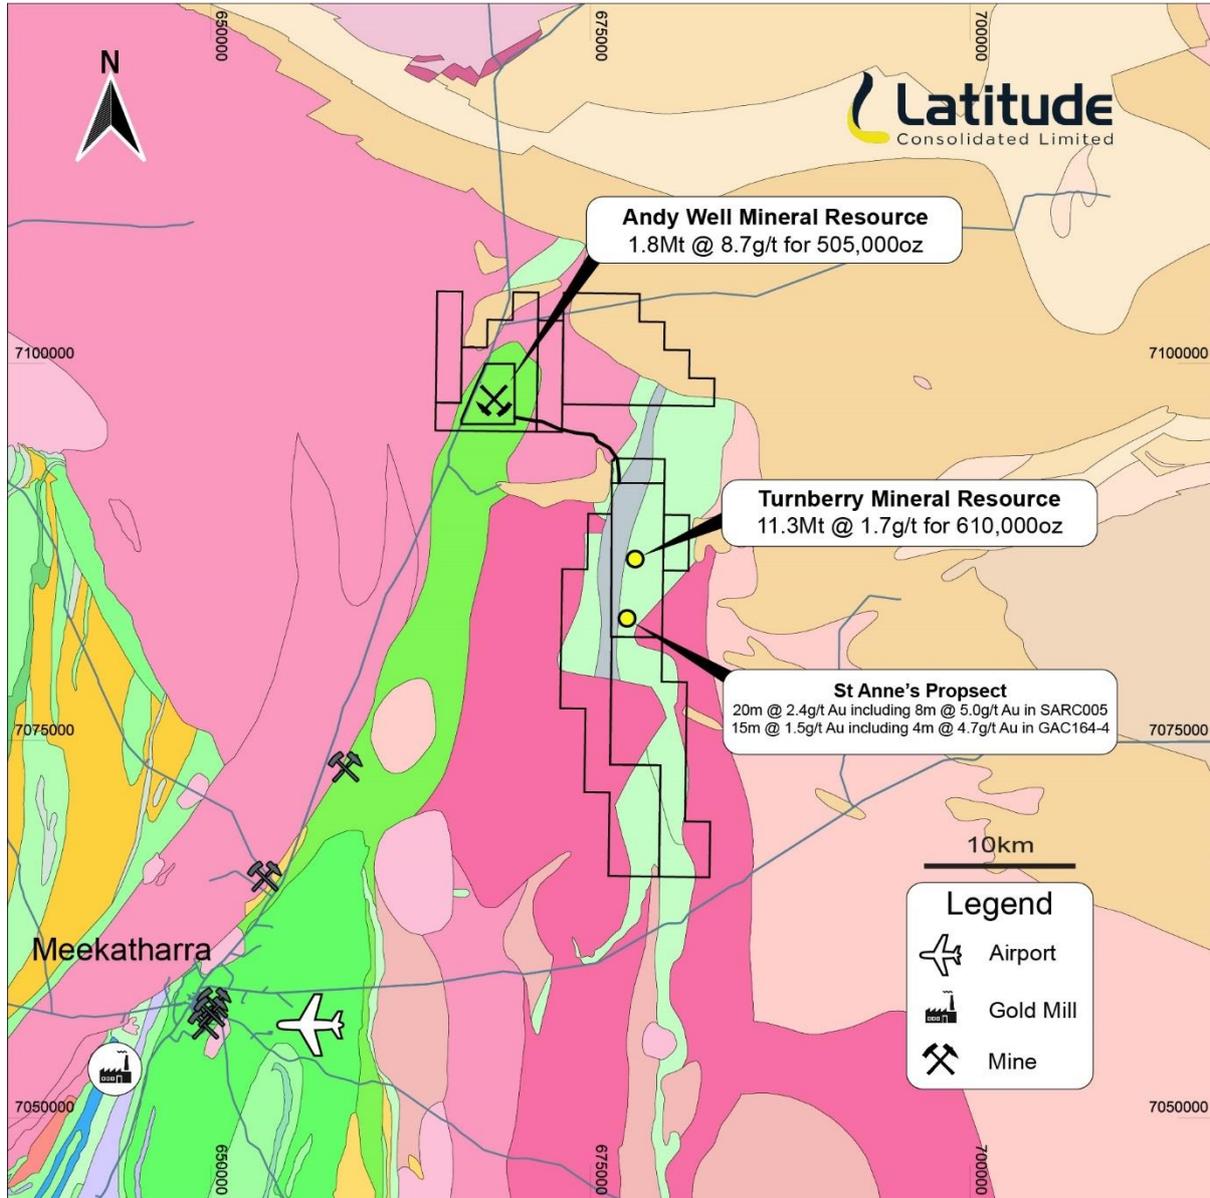

Figure 1: Murchison Gold Project Mineral Resources.

Table 1 – Global Mineral Resource Summary

Project	Measured			Indicated			Inferred			Total

Turnberry				6,800	1.6	355	4,500	1.8	255	11,300	1.7	610
<b>TOTAL</b>	<b>150</b>	<b>11.4</b>	<b>55</b>	<b>7,850</b>	<b>2.7</b>	<b>670</b>	<b>5,150</b>	<b>2.4</b>	<b>390</b>	<b>13,100</b>	<b>2.6</b>	<b>1,115</b>

1. Mineral Resources are produced in accordance with the 2012 Edition of the Australian Code for Reporting of Mineral Resources and Ore Reserves (JORC 2012).
2. Andy Well Mineral Resource is reported using 0.1g/t cut-off grade.
3. Turnberry Open Pit Mineral Resource is reported within a A\$2,400/oz pit shell and above 0.5g/t cut-off grade.
4. Turnberry Underground Mineral Resource is reported outside a A\$2,400/oz pit shell and above 1.5g/t cut-off grade.
5. Numbers in the Mineral Resource table have been rounded.

## TURNBERRY MINERAL RESOURCE

---

Turnberry is located within the Gnaweeda Greenstone Belt on the north-east margin of the Yilgarn Craton within the Murchison Goldfields of Western Australia. The Mineral Resource sits within a granted Mining Lease (M51/882), extends over a strike length of 1.5km and remains open to the north, south and at depth. Importantly, the resource averages 1,850 ounces per vertical metre (OVM) from the surface to a depth of 200m, at which point the number of drill holes drops off significantly. The resource also demonstrates good vertical grade continuity, suggesting that with further drilling, there is potential for resource growth.

The host geological sequence is largely comprised of fractionated dolerite with an ultramafic base, basalt, felsic volcanics and porphyry surrounded by siliciclastic sediments and shales. Stratigraphy is steeply east to sub-vertically dipping and the area is highly weathered with a depth to fresh rock of approximately 100m.

Mineralisation is widespread, occurs within multiple mineralised envelopes and varies in width from 2 to 25 metres. Mineralisation has developed within a number of stratigraphic units including felsic volcanics and porphyries with strong pervasive sericite-pyrite alteration, which host broad gold mineralisation with local sporadic higher grades. Vein and shear mineralisation is also present at the mafic contact which tends to host narrow, high grades with occasional visible gold in RC chips (Figure 3). The best zones of gold mineralisation occur in the central portion of the resource within a highly magnetic, low chromium fractionated dolerite unit. The mineralisation can often be visually indistinct owing to several styles of mineralisation being present depending on the lithology of the host rock.

Figure 2: Magnetic Gabbro hosted mineralisation in RC chips, TBRC062 165-170m (Turnberry Central). The pictured interval represents 5m @ 14.9g/t Au within a wider 41m @ 4.8g/t Au interval. Alteration is Chlorite-Pyrite(3%)-Epidote-Carbonate.

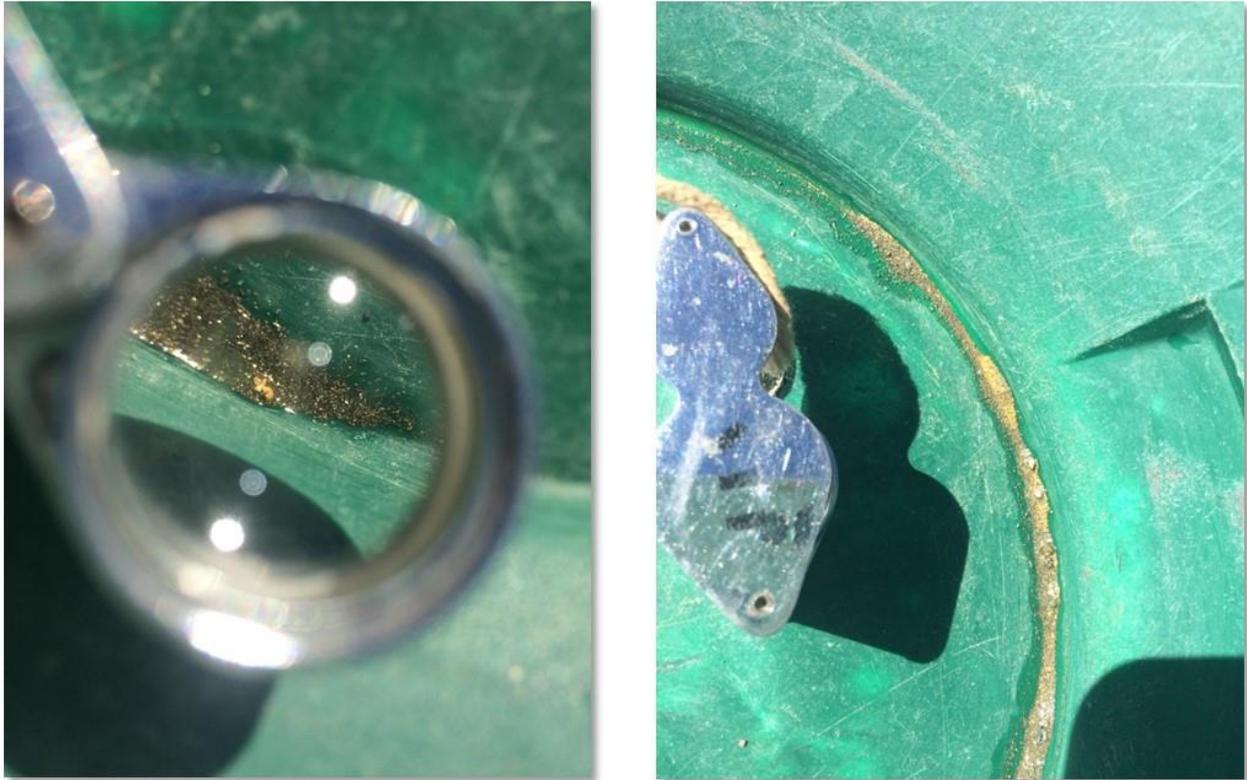

Figure 3: Visible gold in hole TBRC043, within an interval of 7m @ 41.6g/t Au including 2m @ 137.0 g/t Au.

The updated Turnberry Mineral Resource estimate was compiled by Hawker Geological Services Pty Ltd (HGS), an independent geological consultant to the Company. Further to this and as a matter of good practice, independent technical experts CSA Global (CSA) were appointed to conduct a fatal flaw review of the updated Mineral Resource estimate prior to public release. The fatal flaw review by CSA did not identify any fatal flaws with the Mineral Resource estimate.

Having worked through this review process with experienced consultants in HGS and CSA the Company has a high degree of confidence in the updated geological model. There is strong continuity of mineralisation and Latitude is increasingly confident in the quality of the Murchison Gold Project as the Company moves forward with mining studies due for release to the market later this year.

Table 2 – Turnberry Mineral Resource

	Indicated			Inferred			Total		
	Tonnes ('000t)	Grade (g/t)	Ounces ('000oz)	Tonnes ('000t)	Grade (g/t)	Ounces ('000oz)	Tonnes ('000t)	Grade (g/t)	Ounces ('000oz)
Open Pit	6,450	1.5	305	3,650	1.5	175	10,100	1.5	480
Underground	350	4.1	50	850	3.0	80	1,200	3.4	130
<b>Total</b>	<b>6,800</b>	<b>1.6</b>	<b>355</b>	<b>4,500</b>	<b>1.8</b>	<b>255</b>	<b>11,300</b>	<b>1.7</b>	<b>610</b>

1. Mineral Resources are produced in accordance with the 2012 Edition of the Australian Code for Reporting of Mineral Resources and Ore Reserves (JORC 2012).
2. Turnberry Open Pit Mineral Resource is reported within a A\$2,400/oz pit shell and above 0.5g/t cut-off grade.
3. Turnberry Underground Mineral Resource is reported outside a A\$2,400/oz pit shell and above 1.5g/t cut-off grade.
4. Numbers in the Mineral Resource table have been rounded.

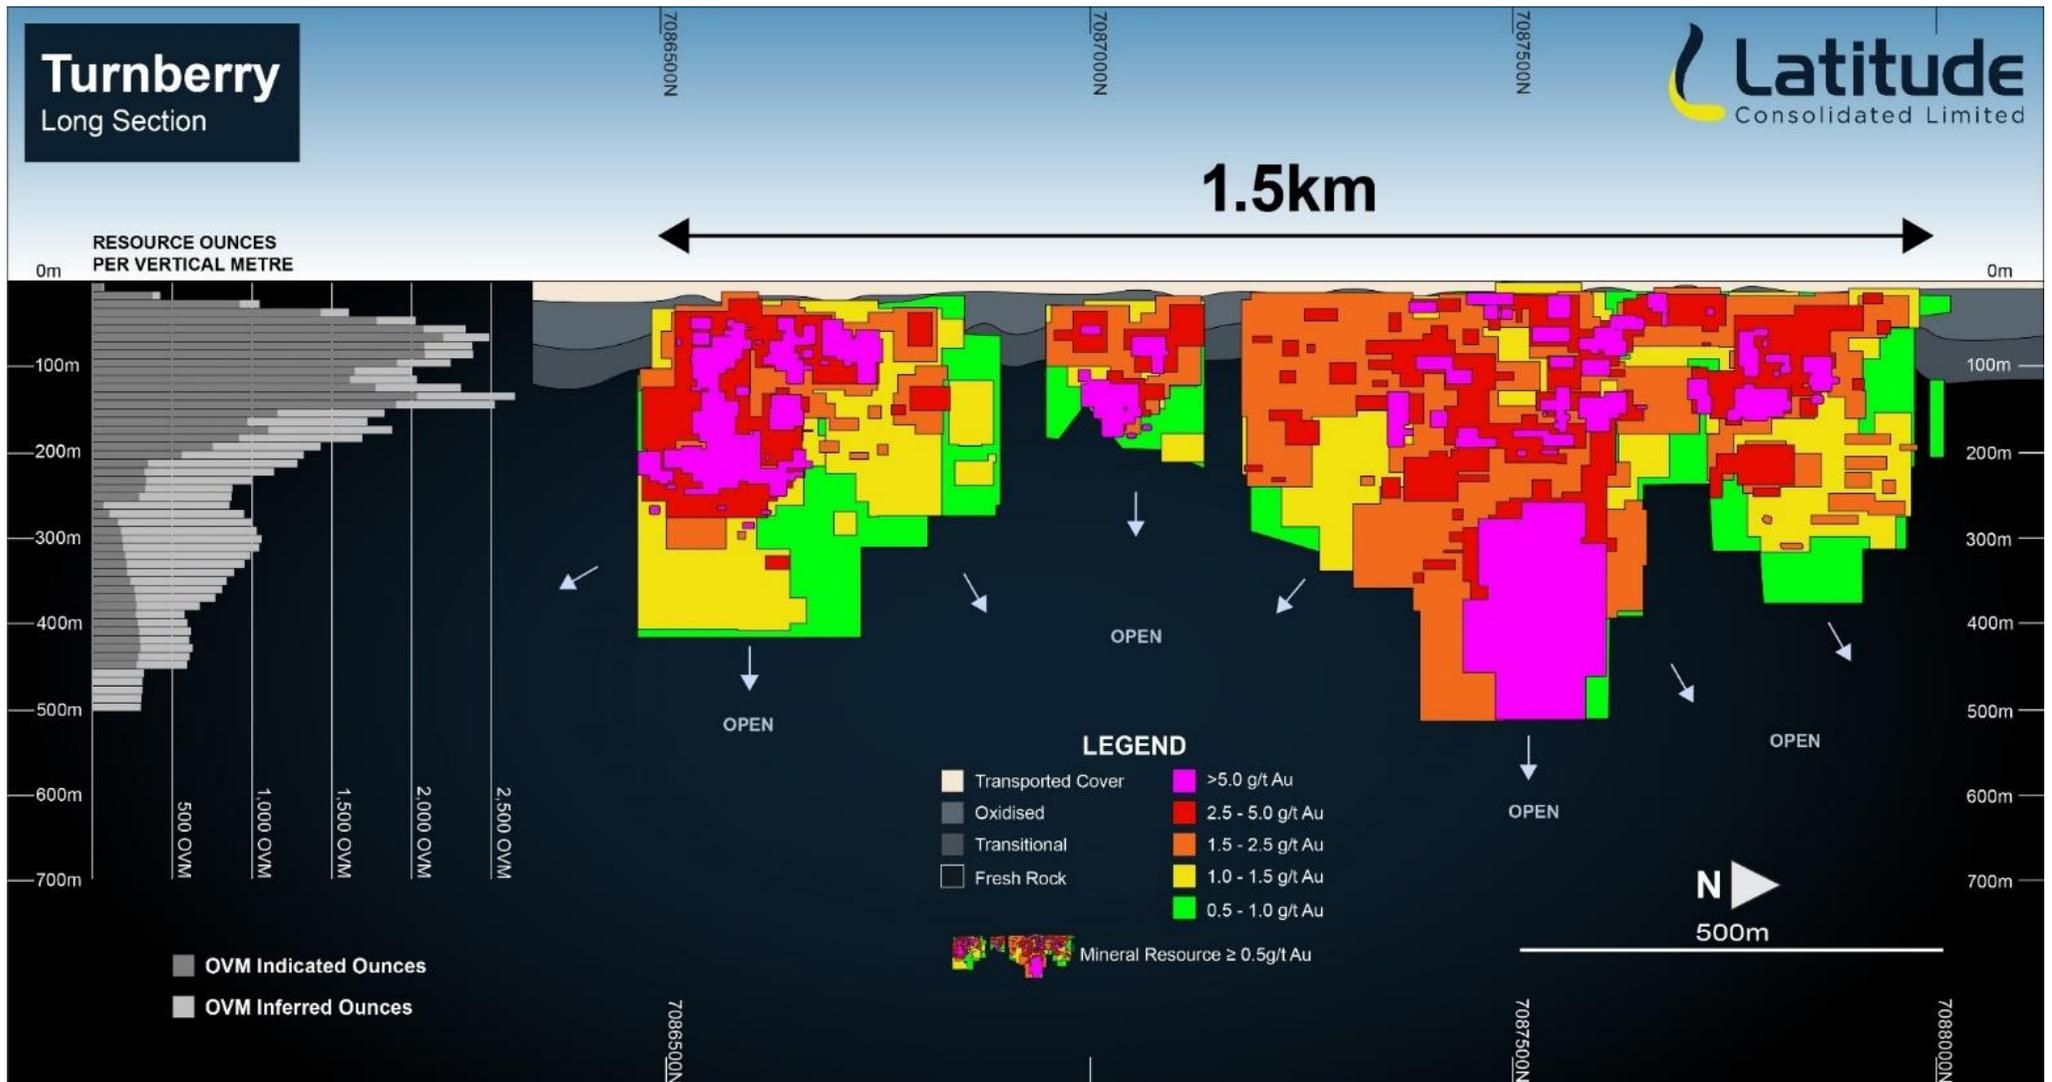

Figure 4: Turnberry Mineral Resource grade contour and OVM's.

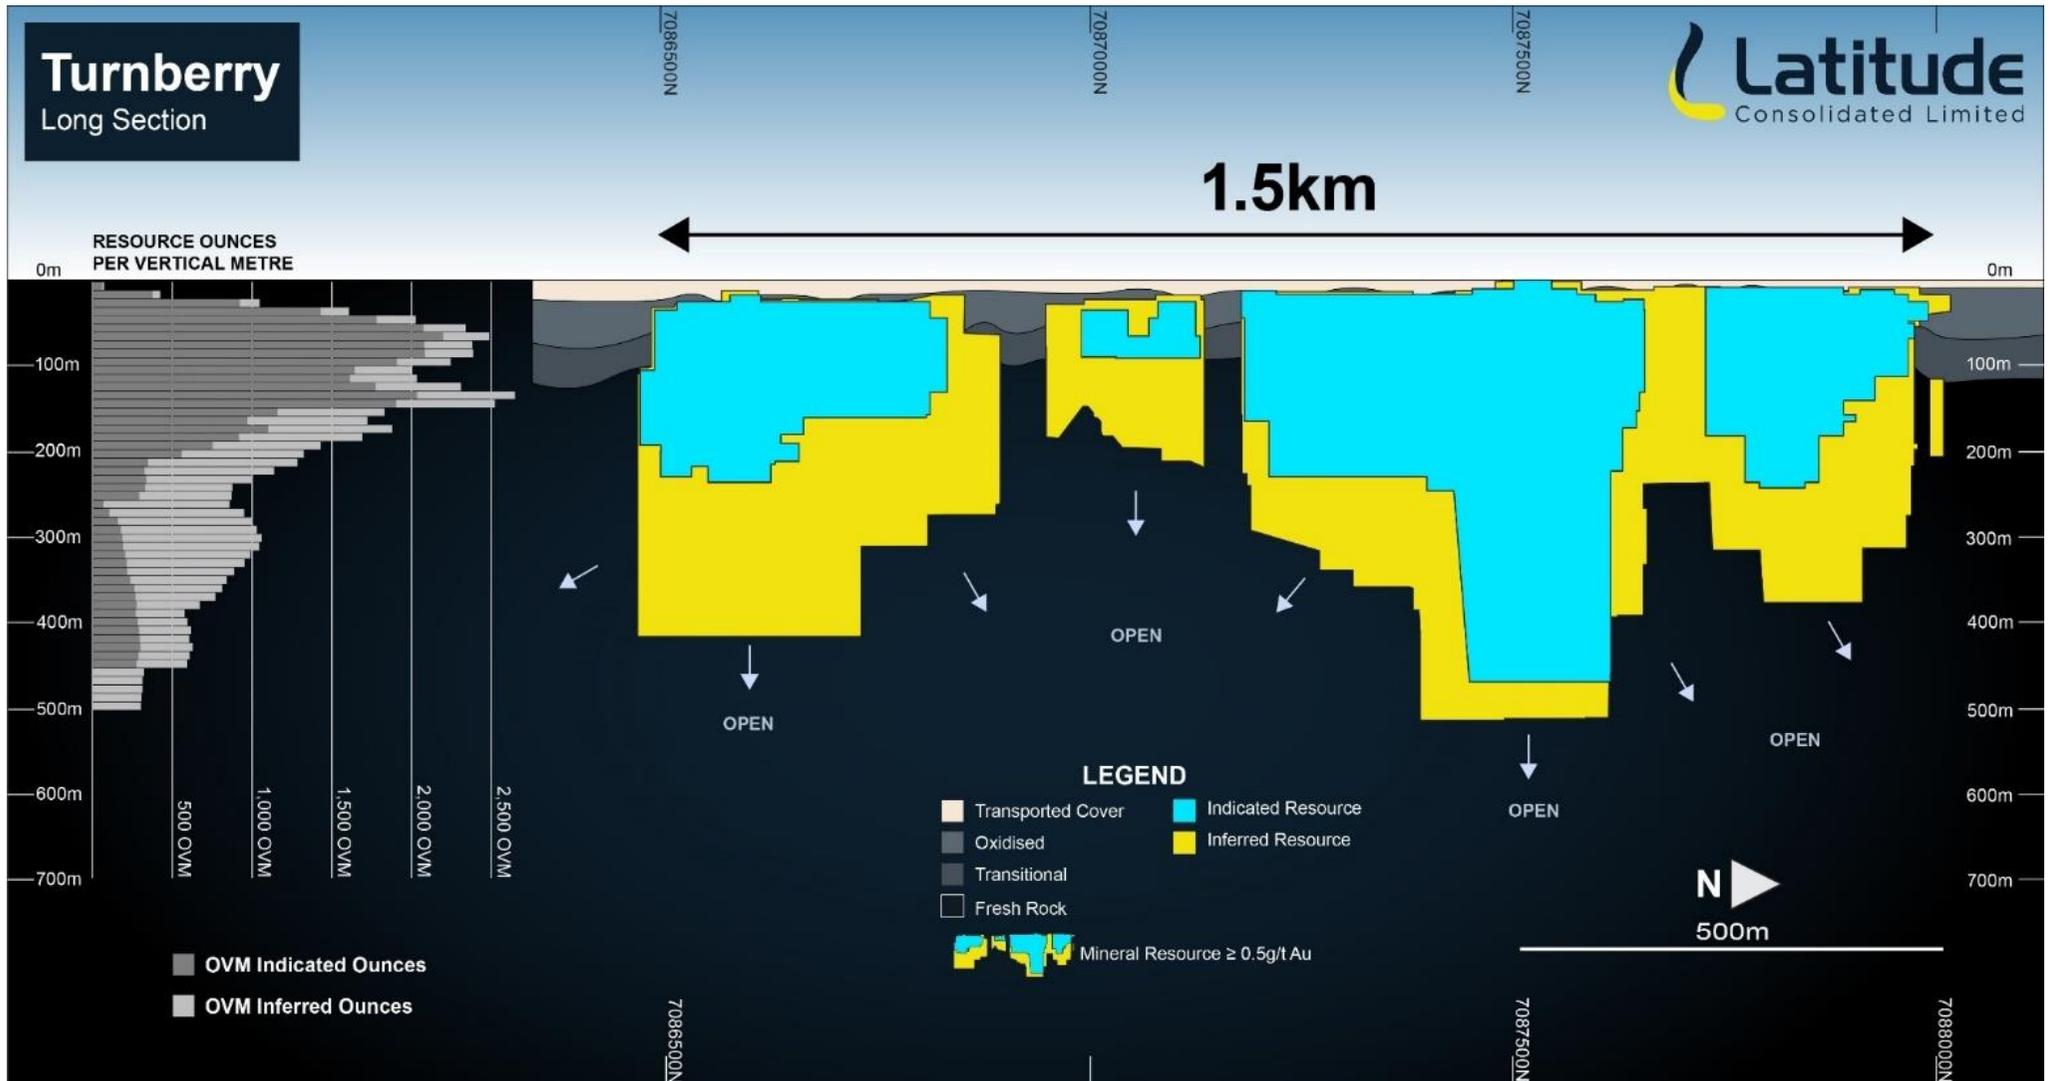

Figure 5: Turnberry Mineral Resource classification contour and OVM's.

## COMPARISON WITH PREVIOUS MINERAL RESOURCE ESTIMATES

Review of the documents relating to the historical Mineral Resource estimate for the Turnberry deposit show that modelling of the resource was performed in a manner so as to produce a low tonnage, high grade estimate that could be processed by the low throughput Andy Well mill. A comparison of the historical 2019 Mineral Resource estimate with the current estimate is presented in Table 3.

Table 3 – comparison of the historical (2019) and current (2021) Turnberry Mineral Resource estimate

	2019 Historical Estimate			2021 Current Estimate			Variance		
	Tonnes ('000t)	Grade (g/t)	Ounces ('000oz)	Tonnes ('000t)	Grade (g/t)	Ounces ('000oz)	Tonnes %	Grade %	Ounces %
Indicated	2,043	2.2	146	6,800	1.6	355	233%	-27%	143%
Inferred	2,196	1.8	124	4,500	1.8	255	105%	0%	106%
<b>Total</b>	<b>4,239</b>	<b>2.0</b>	<b>271</b>	<b>11,300</b>	<b>1.7</b>	<b>610</b>	<b>167%</b>	<b>-15%</b>	<b>125%</b>

Although this approach was strategically valid and was also reflective of the gold price environment at the time, it resulted in a large number of mineralised intersections present in drilling being left out of the historical Mineral Resource estimates. An example of this can be seen in Figure 6 and Figure 7 which shows northing section 7087840N overlain with historical resource wireframes and the updated resource wireframes respectively.

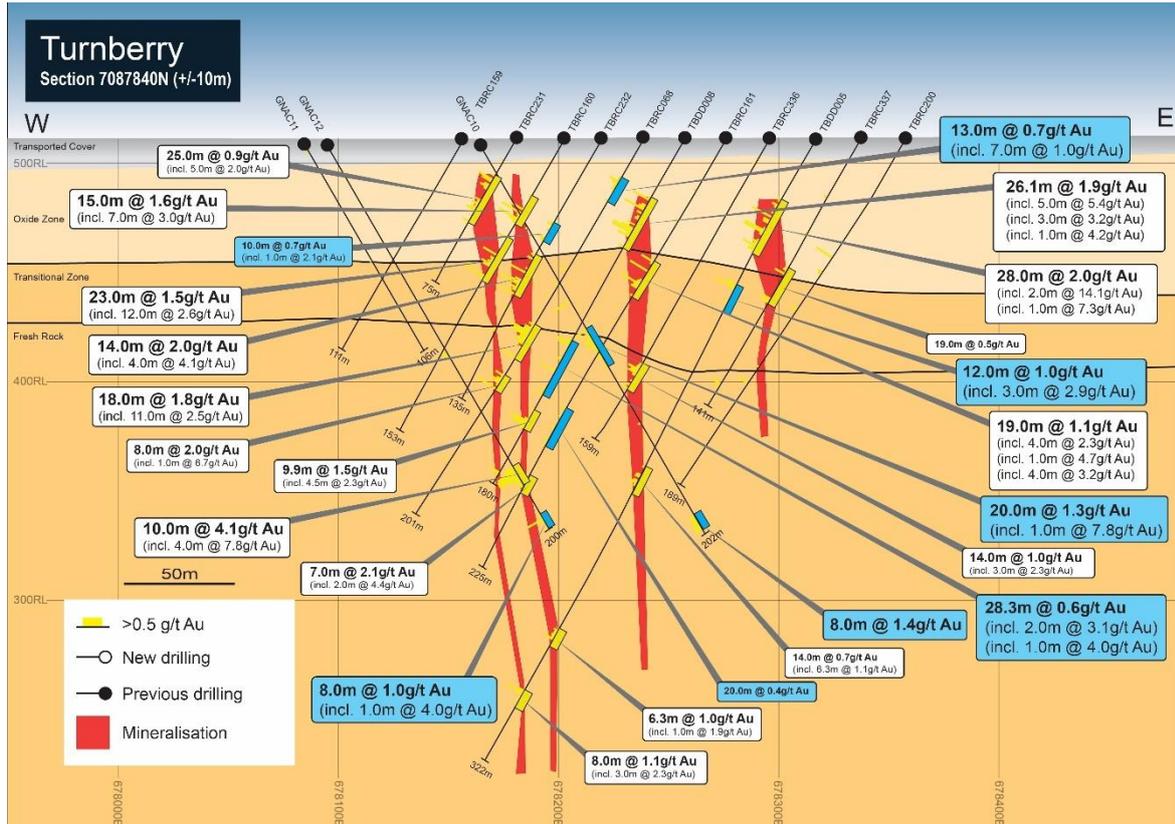

Figure 6: Cross section showing historic resource wireframes and significant number of ore grade intercepts not captured in the historical Mineral Resource estimate.

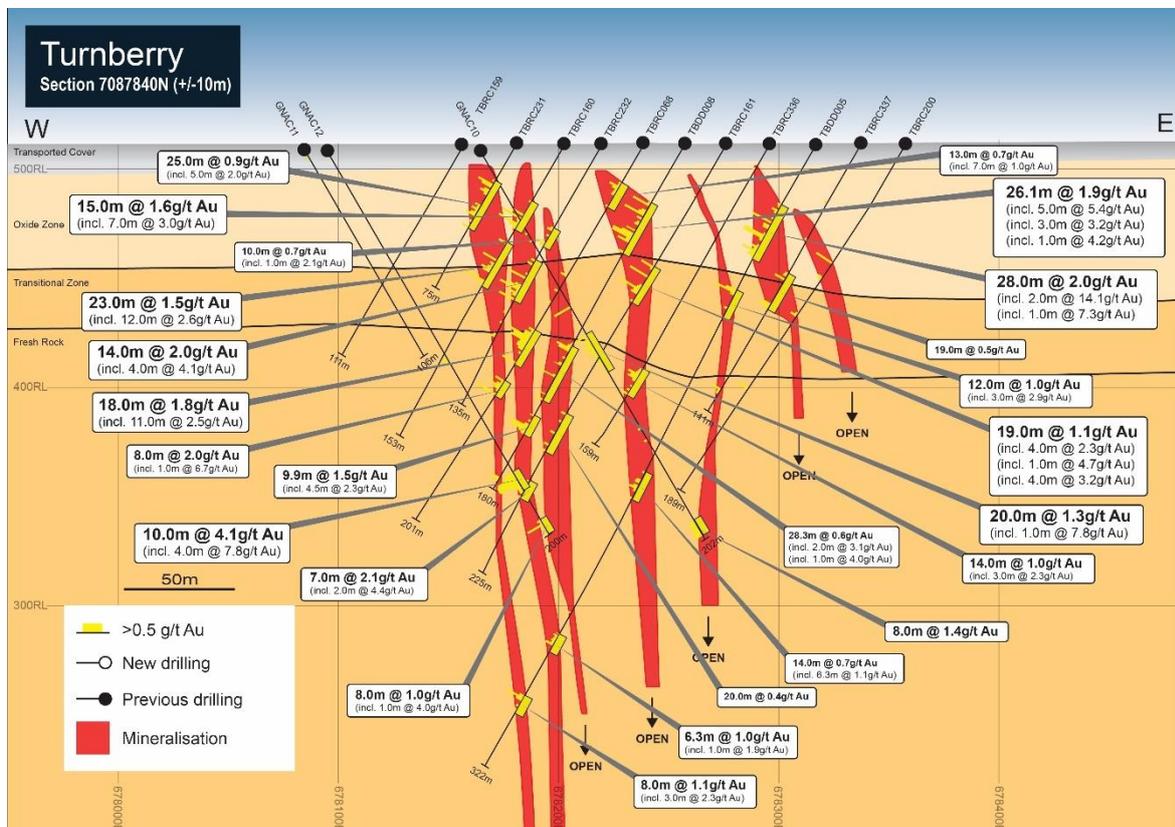

Figure 7: Cross section showing current resource wireframes used for updated 2021 Mineral Resource estimate capturing all mineralised intercepts.

In total the historical Turnberry Mineral Resource estimate contained only 16 discrete lodes as can be seen in Figure 8. The updated Mineral Resource captures all mineralisation present in drill holes resulting in a total of 43 discrete lodes forming the updated Mineral Resource estimate (Figure 9).

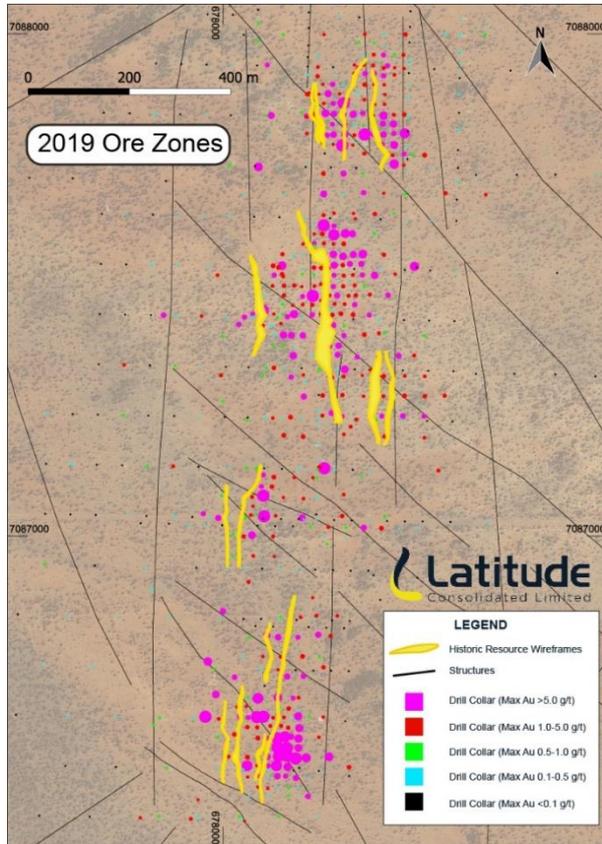

Figure 8: Drill holes and historic resource wireframes.

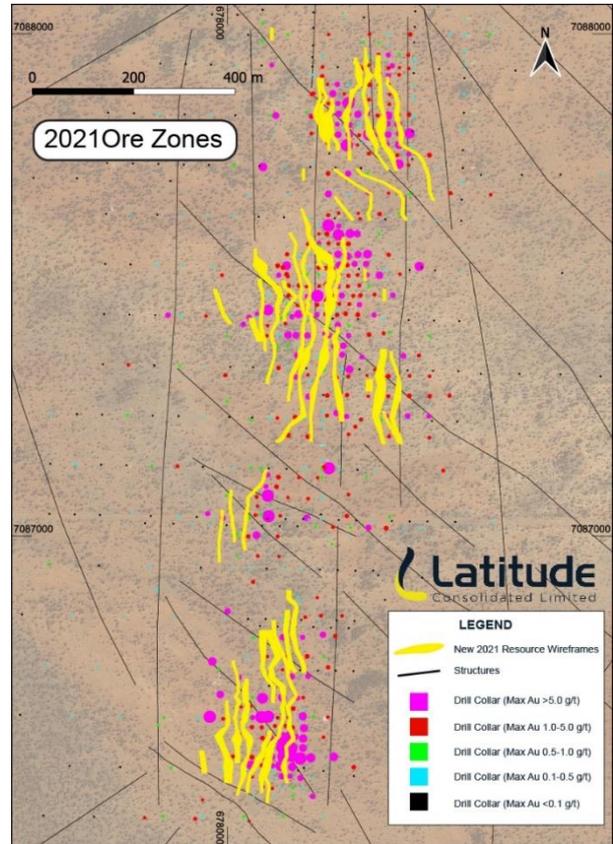

Figure 9: Drill holes and new 2021 resource wireframes.

Additionally, the historical Mineral Resource estimate applied a 1.0g/t gold reporting cut-off grade. Latitude has taken a conservative approach with this update and only reported open pit Mineral Resources as the portion of the resource that is constrained within a A\$2,400/oz optimised pit shell and above a 0.5g/t gold cut-off grade. The portion of the Mineral Resource Estimate that sits beneath the open pit shell is reported using a 1.5g/t gold cut-off grade.

## RESOURCE GROWTH POTENTIAL

Turnberry remains open to the north and south within a broad 5.5km trend of gold anomalism evident in drilling and associated with a similar geological stratigraphy (Figure 10). Magnetic anomalies along strike of Turnberry which appear to truncate stratigraphy or form discrete bodies are interpreted to be similar in character to the Turnberry magnetic feature and form part of Latitude’s targeting strategy. The most advanced of these targets is the St Anne’s prospect which displays a similar magnetic signature to Turnberry and similar grade and width intercepts in drilling, including:

- **20m @ 2.4g/t Au** from 57m including **8m @ 5.0g/t Au** in SARC005
- **15m @ 1.5g/t Au** from 104m including **4m @ 4.7g/t Au** in GAC164-4

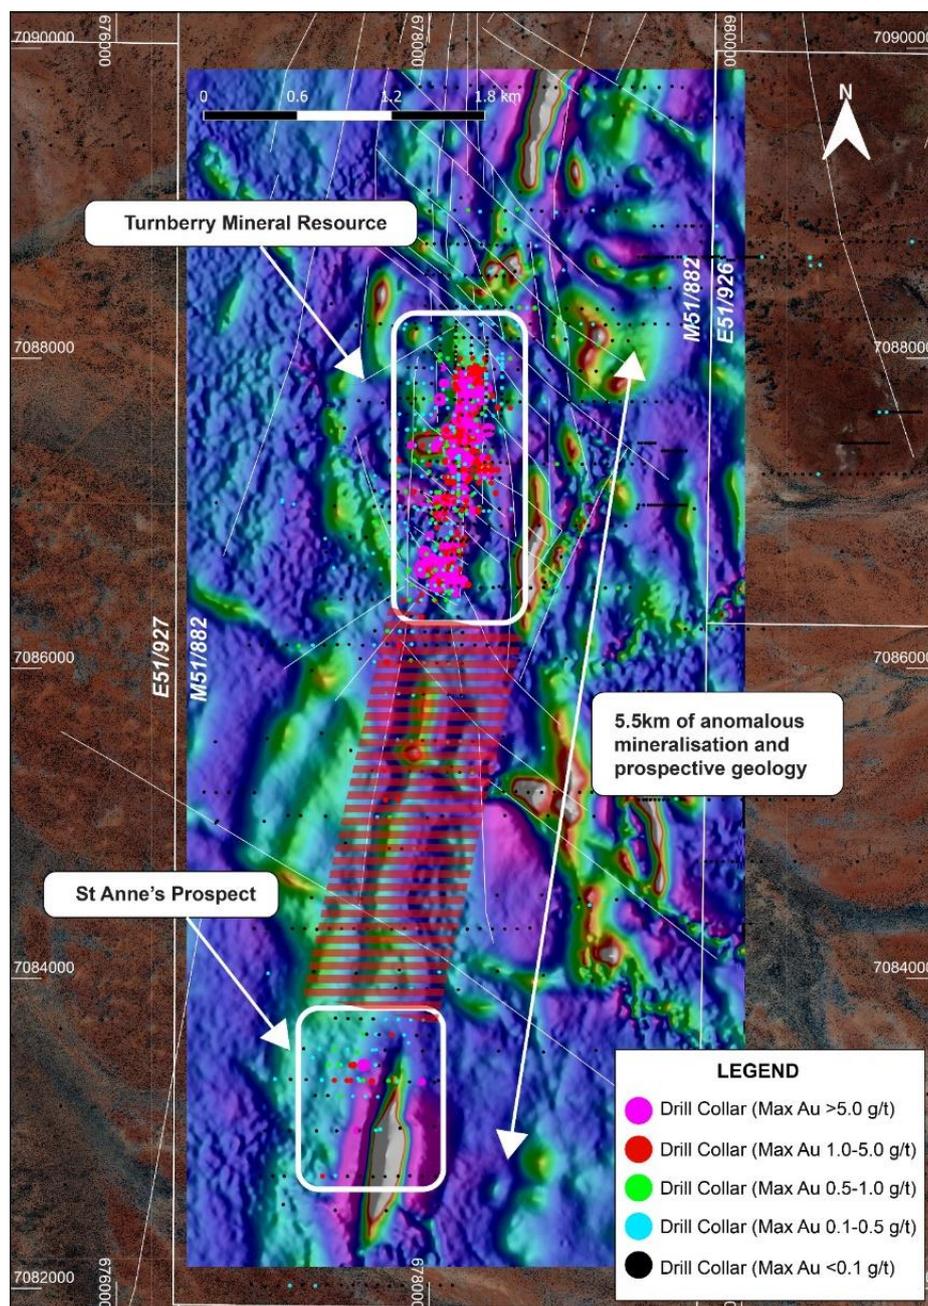

Figure 10: Turnberry – St Anne’s mineralised corridor in plan view.

The St Anne's corridor presents a significant exploration opportunity for the Company given the limited drilling completed along the 3.5km strike south of the Turnberry Mineral Resource and the anomalous gold observed in this drilling. The corridor has not been effectively drill tested with limited broadly spaced lines of aircore and RC holes. Spacing between sections varies from 100m up to 300m and holes on the same section are spaced from 80m up to 200m between collars. Given the large number of anomalous gold results within this corridor the company intends to drill test the magnetic anomalies and existing identified mineralisation.

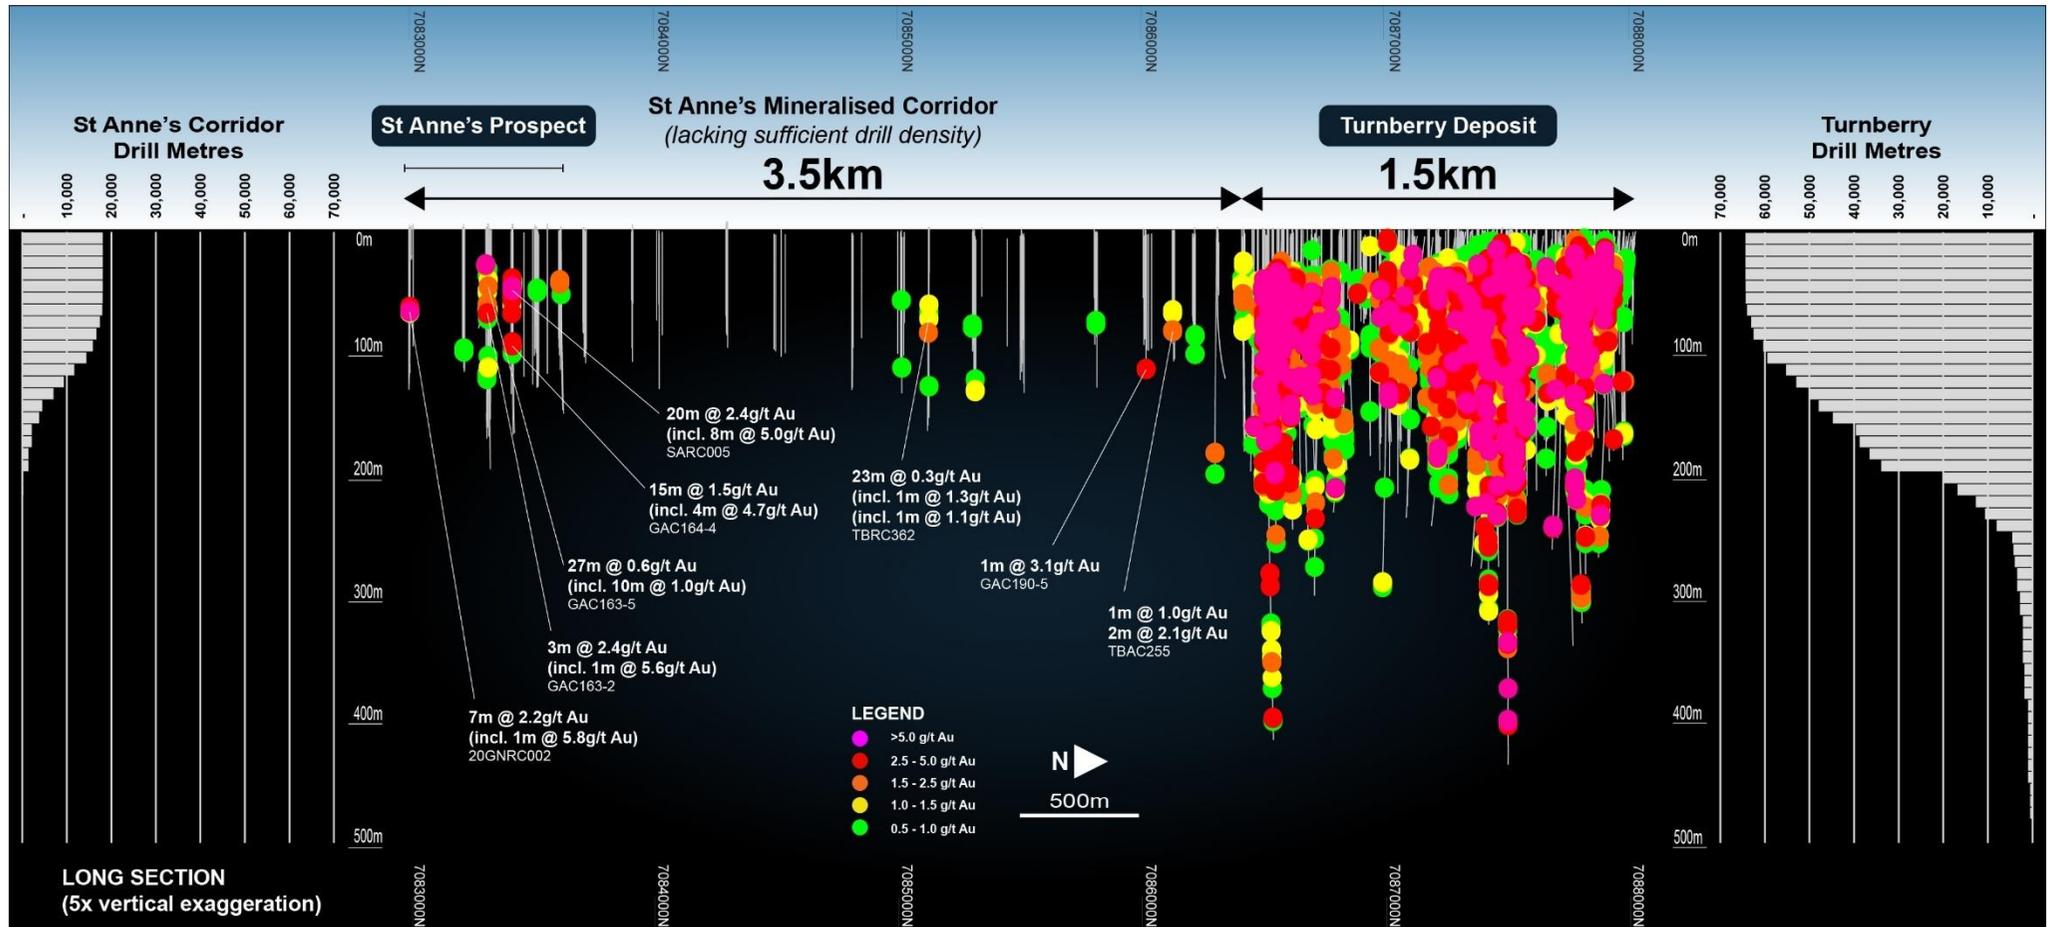

Figure 11: Turnberry – St Anne's mineralised corridor with drilling in section view (5x vertical exaggeration).

This announcement has been authorised for release by the Latitude Board of Directors.

## **COMPETENT PERSON'S STATEMENT**

---

The information in this release that relates to Exploration Results as those terms are defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserve", is based on information reviewed by Mr Andrew Hawker, a Competent Person who is a member of The Australasian Institute of Mining and Metallurgy. Mr Hawker is an independent consultant to Latitude Consolidated. Mr Hawker has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Hawker consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to Mineral Resources for the Andy Well deposit is based upon information reviewed by Mr Andrew Hawker, a Competent Person who is a member of The Australasian Institute of Mining and Metallurgy. ## **TURNBERRY MINERAL RESOURCE – SUMMARY OF MATERIAL INFORMATION**

---

### **GEOLOGY AND GEOLOGICAL INTERPRETATION**

Turnberry is located at the northernmost end of the north-south trending Archaean Gnaweeda Greenstone Belt (GGB), a narrow belt of Archaean volcano-sedimentary rocks up to ten kilometres wide in the northern half and decreasing to less than one kilometre in the south. GGB is separated from the adjacent sub-parallel Meekatharra-Widgie Greenstone Belt located 7km to the east by an envelope of gneiss and massive granitoid. At Turnberry the GGB comprises a succession of metamorphosed mafic to ultramafic, felsic and metasedimentary rocks with minor felsic to intermediate intrusives interpreted to belong to the Norie Group, formerly Luke Creek, within the Murchison Supergroup.

Structurally the GGB is situated along the northernmost extent of two main structural lineaments bounding the Murchison and Southern Cross Domains, the Evanstone-Edale and the Youanmi shear zones. Regionally both lineaments are associated with several other gold occurrences in the Sandstone greenstone belt sequence.

The Turnberry area is covered with transported colluvium to a depth of ~10-25m overlying a laterally extensive leached profile approximately ~10-20m thick. The area is highly weathered with a depth to fresh rock of approximately 100m.

The geological package is largely comprised of fractionated dolerite with an ultramafic base, basalt, felsic volcanoclastics and porphyry surrounded by a package of siliciclastic sediments and shales. Stratigraphy is steeply east to sub-vertically dipping which is interpreted from portable XRF analysis to be isoclinally folded along a north-northeast fold axis with a north-northeast trending foliation.

Lithologies at Turnberry are dominated by dolerites with the best section of mineralisation hosted within a magnetic quartz dolerite which forms a discrete 'double bullseye' aeromagnetic anomaly. The magnetic dolerite is likely to represent a fractionated portion of a layered dolerite sill with a contribution of magnetite from alteration creating the anomaly within the hinge of the folded mafic. This mineralisation style is the most well developed at Turnberry as it hosts the highest and most consistent grades and widths.

Preliminary structural interpretation suggests that the mineralisation may be aligned along north-northeast trending interpreted fold axes and sub parallel to the regional fabric. The northern part of Turnberry is defined by a folded, differentiated mafic sill that is younging south as determined by interpretation of Chromium (Cr) by portable XRF and has a sharp, often sheared, contact with lower felsic volcanic units. Folds are interpreted to plunge steeply North in the northern part of Turnberry and more sub-vertical in the southern part. Several northwest-southeast structures are interpreted from geophysical imagery to crosscut the stratigraphy and appear to offset both lithology and mineralisation.

Mineralisation at Turnberry forms a 1.5km north-northeast trending gold anomalous corridor which is broadly defined into three zones, Turnberry South, Central and North. Mineralisation is widespread and occurs within multiple mineralised envelopes but predominantly concentrated in interpreted fold closures with a probable sub-vertical plunge. Mineralisation can often be visually indistinct owing to several styles of mineralisation being present and manifested differently depending on the lithology of the host rock. There are a number of

unrelated shearing and veining events however gold is usually accompanied by an increase in disseminated pyrite.

## **SAMPLING AND SUB-SAMPLING TECHNIQUES**

Diamond Drilling HQ3 size core collected in sample trays, core is marked and cut in half. Diamond core samples are collected on a nominal 1m interval, but based on geology. Minimum sample width of 0.3m and a maximum of 1.3m.

RC chips are collected through a cyclone and cone split and sampled dry where possible in 1m intervals. RC chip recovery is logged and recorded in the database. The sample splitter is cleaned at the end of every rod to minimise contamination.

All drillholes are logged by geology staff to a level of detail that supports resource estimation. This includes lithology, structure, veining, alteration and mineralisation. All RC chip trays are archived.

All samples are bagged in a calico bag, grouped into larger polyweave bags and cable tied. Polyweave bags are placed in larger bulka bags with a sample submission sheet and tied shut. Consignment notes and delivery address details are written on the side of the bag and dispatched from Andy Well mine site directly via Coastal Midwest Transport. The bags are delivered directly to Minanalytical in Canning Vale, WA who are NATA accredited for compliance with ISO/IEC17025:2005.

## **DRILLING TECHNIQUES**

Since 2015 396 RC drillholes (60,849m) and 12 RC/ Diamond drill holes (3,887.3m) have been completed for a total of 408 drillholes (64,736.3m). This includes a 20,878m RC and 1,997.5m diamond drilling programme which was conducted between April and August 2017.

## **SAMPLE ANALYSIS METHOD**

All samples pulverized to 75µm and all samples analysed by 25g Fire Assay and AAS finish.

## **ESTIMATION METHODOLOGY**

The raw assay data for each domain was composited to 1m intervals (the dominant sample size due to 94% of the deposit being RC drilled) within the interpreted domain. Top-cuts were applied where population outliers were identified.

Gold grade was estimated using Ordinary Kriging into 2mE x 10mN x 5mRL parent blocks and sub-celled to 0.5mE x 2.5mN x 1.25mRL.

The model was validated through a series of swath plots and visual comparisons of drillholes to block model grades in section view.

## **CLASSIFICATION**

A proposed Indicated or Inferred classification has been applied to all estimated blocks. The classification is determined by drill spacing, estimation attributes and overall geological confidence in the block grade.

## **CUT-OFF GRADES AND OTHER PARAMETERS**

The Turnberry Mineral Resource is reported using both open pit and underground mining constraints.

The open pit Mineral Resource is only the portion of the resource that is constrained within a A\$2,400/oz optimised pit shell and above a 0.5g/t gold cut-off grade. The optimised open pit shell was generated using:

- Mining practices and costs assumptions in line with from similar scale open pit mining operations in Western Australia;
- Processing costs in line with similar scale processing operations in Western Australia; and,
- Pit slope angels determined from geotechnical studies completed for the project, ranging from 45° to 60° and applied based weathering profile.

The underground Mineral Resource is only the portion of the resource that sits beneath the open pit shell and is reported using a 1.5g/t gold cut-off grade. This is deemed suitable for the style of mineralisation and scale of deposit being evaluated.

## **MINING AND METALLURGICAL FACTORS OR ASSUMPTIONS**

Mining and metallurgical factors are applied in determining the potential for economic extraction, however no mining or metallurgical factors have been applied to the resource estimate as reported.

(Criteria listed in the preceding section also apply to this section.)

CRITERIA	JORC CODE EXPLANATION	COMMENTARY
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>Latitude Consolidated Limited controls a 100% interest in M51/882 and the tenement is in good standing.</li> <li>M51/882 is located within the Yugunga-Nya Native Title Claim.</li> <li>Heritage surveys have been conducted over active exploration areas.</li> <li>Teck holds an 8.8% net profit interest which is paid only after all expenses incurred by the project (including historical exploration expenses) are recovered by Latitude Consolidated Limited.</li> <li>Milestone payments of \$5/oz produced are to be paid to Archean Star Resources Australia Pty Ltd, capped at \$1m.</li> </ul>

CRITERIA	JORC CODE EXPLANATION	COMMENTARY
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>Historic exploration was carried out at Turnberry by ASRA, Teck and Newcrest including drilling and geophysics</li> </ul>
<b>Geology</b>	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>Geology consists of Archean aged orogenic style mineralisation. Primary mineralisation is interpreted to be hosted within a moderate shear zone(s) +/- stringer quartz veins within both mafic and felsic lithologies. Some supergene mineralisation is developed locally and defined by ferruginous red saprolite clays.</li> </ul>
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>All drill results are reported quarterly to the Australian Stock Market (ASX) in line with ASIC requirements.</li> </ul>
<b>Data aggregation methods</b>	<ul style="list-style-type: none"> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<ul style="list-style-type: none"> <li>No top-cuts have been applied when reporting results.</li> <li>First assay from the interval in question is reported.</li> <li>Aggregate sample assays are calculated using a length-weighted.</li> <li>Significant intervals are based on the logged geological interval, with all internal dilution included.</li> <li>No metal equivalent values are used for reporting exploration results.</li> </ul>
<b>Relationship between mineralisation widths and intercept lengths</b>	<ul style="list-style-type: none"> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> </ul>	<ul style="list-style-type: none"> <li>Drill holes are oriented at right angles to strike of deposit, dip optimized for drilling purposes and dip of ore body. Down hole widths are reported with most drill holes intersecting the mineralised lenses at 30-40 degrees.</li> </ul>

CRITERIA	JORC CODE EXPLANATION	COMMENTARY
	<ul style="list-style-type: none"> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</li> </ul>	<ul style="list-style-type: none"> <li>Strike of mineralisation is approximately 005 deg dipping to the west and East at 080 deg, based on lode geometry.</li> </ul>
<b>Diagrams</b>	<ul style="list-style-type: none"> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	<ul style="list-style-type: none"> <li>Drilling is presented in long-section and cross section as appropriate and reported quarterly to the Australian Stock Market (ASX) in line with ASIC requirements.</li> </ul>
<b>Balanced reporting</b>	<ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>All drillhole results have been reported including those drill holes where no significant intersection was recorded.</li> </ul>
<b>Other substantive exploration data</b>	<ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	<ul style="list-style-type: none"> <li>All meaningful and material data is reported.</li> </ul>
<b>Further work</b>	<ul style="list-style-type: none"> <li>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<ul style="list-style-type: none"> <li>Follow up work at Turnberry will comprise of further infill and extensional drilling programs to continue to develop the resource potential.</li> </ul>

### Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

CRITERIA	JORC CODE EXPLANATION	COMMENTARY
<b>Database integrity</b>	<ul style="list-style-type: none"> <li>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</li> <li>Data validation procedures used.</li> </ul>	<ul style="list-style-type: none"> <li>Geological data is stored in a Data Shed SQL server database. User access to the database is regulated by specific user permissions and validation checks to ensure data is valid.</li> <li>Existing protocols maximize data functionality and quality whilst minimizing the likelihood of error introduction at primary data collection points and subsequent database upload, storage and retrieval points.</li> </ul>

CRITERIA	JORC CODE EXPLANATION	COMMENTARY
		<p>Data templates with lookup tables and fixed formatting are used for collecting primary data using Logchief software on field laptops. The software has validation routines and data is subsequently imported into a secure central database.</p> <ul style="list-style-type: none"> <li>The SQL server database is configured for validation through parent/child table relationships, required fields, logical constraints and referenced library tables. Data that fails these rules on import is rejected or quarantined until it is corrected.</li> <li>The SQL server database is centrally managed by a Database Administrator who is responsible for all aspects of data entry, validation, development, and quality control &amp; specialist queries. There is a standard suite of validation checks for all data.</li> </ul>
<b>Site visits</b>	<ul style="list-style-type: none"> <li><i>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</i></li> </ul>	<ul style="list-style-type: none"> <li>The Competent Person for this update is a contractor to the company and has undertaken site visits ensuring industry standards of the Mineral Resource estimation process from sampling through to final block model estimation.</li> </ul>
	<ul style="list-style-type: none"> <li><i>If no site visits have been undertaken indicate why this is the case.</i></li> </ul>	<ul style="list-style-type: none"> <li>N/A</li> </ul>
<b>Geological interpretation</b>	<ul style="list-style-type: none"> <li><i>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</i></li> </ul>	<ul style="list-style-type: none"> <li>Due to the amount of data sourced from drill programs and consistent geologically logging, there is a high degree of confidence in the geological interpretation of the Turnberry Deposit.</li> <li>Uncertainty inevitably increases as the drill spacing increases which is reflected in the classification of the Resource from Indicated (average 20m x 20m) to Inferred (generally 40m x 40m).</li> </ul>
	<ul style="list-style-type: none"> <li><i>Nature of the data used and of any assumptions made.</i></li> </ul>	<ul style="list-style-type: none"> <li>The dataset (geological mapping, RC and diamond core logging and assays etc.) is considered acceptable for determining a geological model.</li> </ul>
	<ul style="list-style-type: none"> <li><i>The effect, if any, of alternative interpretations on Mineral Resource estimation.</i></li> </ul>	<ul style="list-style-type: none"> <li>Alternative interpretations have been investigated as larger tonnage and lower grade domains (based on a 0.5g/t cut-off for interpretation). The overall effect is lower grade, more tonnes but a comparable amount of contained metal.</li> </ul>
	<ul style="list-style-type: none"> <li><i>The use of geology in guiding and controlling Mineral Resource estimation.</i></li> </ul>	<ul style="list-style-type: none"> <li>The geological package is largely comprised of three main units; a dominantly mafic package containing a differentiated basalt and gabbro, a felsic volcanoclastic, a siliciclastic</li> </ul>

CRITERIA	JORC CODE EXPLANATION	COMMENTARY
	<ul style="list-style-type: none"> <li><i>The factors affecting continuity both of grade and geology.</i></li> </ul>	<p>siltstone/shale unit. The units strike approximately N-S and are dominated by similarly trending shearing which is cross cut by several N-SE structures which appear to offset both lithology and mineralisation.</p> <ul style="list-style-type: none"> <li>Primary mineralisation is interpreted to be hosted within moderate to strongly developed shear zones with stringer quartz veins, within both mafic and felsic lithologies. Higher grade mineralisation appears to be associated within a more favourable zone of the differentiated basalt unit, which has been subjected to regional scale folding.</li> <li>Mineralised domains are interpreted to be striking north-south with a near vertical dip with one zone of supergene enrichment.</li> </ul> <p>Continuity of geology and grade can be generally be traced from section to section using geochemical and visual attributes. Grade continuity follows the overall structural NNE trend.</p>
<b>Dimensions</b>	<ul style="list-style-type: none"> <li><i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</i></li> </ul>	<ul style="list-style-type: none"> <li>The Resource extends over 1,500m strike, from 10m to 300m below surface and remains open at depth. These extents host 43 known ore zones (ore domains). The ore zones vary between 2m to 25m in width.</li> </ul>
<b>Estimation and modelling techniques</b>	<ul style="list-style-type: none"> <li><i>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i></li> <li><i>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes</i></li> </ul>	<ul style="list-style-type: none"> <li>Ordinary Block Kriging of 1m composites was used for the grade estimation of gold.</li> <li>A 3D block model consisting of 2mE x 10mN x 5mRL parent blocks and subcelled to 0.5mE x 2.5mN x 1.25mRL.</li> <li>Data spacing, geometry of mineralised zones and volume fill were the primary considerations taken into account when selecting an appropriate estimation block size.</li> <li>Surpac was used in the construction of wireframes and for grade interpolation.</li> <li>Statistical analysis and variogram modelling were carried out. Domains with limited sample numbers utilised variogram models derived from similar geological and mineralogical domains.</li> <li>Kriging Neighborhood Analysis was used to aid the selection of relevant estimate and search parameters.</li> <li>The estimate was checked against previous estimates.</li> </ul>
