

GROUND GEOPHYSICS TARGETING NICKEL SULPHIDES COMMENCED AT HILDITCH

- 2.5 sqkm high-powered Fixed Loop Electromagnetic Survey (FLEM) commenced at priority Hilditch Nickel target, 9km north of Wattle Dam Gold Mine.
- Geophysics survey aims to define prospective zones for nickel sulphide mineralisation prior to drill testing.
- Ground FLEM survey covers outcropping nickel bearing gossan, and several promising legacy nickel / copper drill intersections which include:
 - 2.0m @ 2.4% Ni, 0.5% Cu from 73.0m (HRC025)
 - 4.0m @ 1.8% Ni, 0.5% Cu from 25.0m (HRC052)
 - 20.0m @ 0.8% Ni incl 9.0m @ 1.0% Ni from 14.0m (SRRB0240)
- Survey area also incorporates recently drilled Hilditch West target with assays expected to be received in the coming weeks.

Maximus Resources Limited ('Maximus' or the 'Company', ASX:MXR) is pleased to advise the commencement of a 2.5 sqkm of Fixed Loop Electromagnetic geophysics Survey (FLEM) at the Company's high-priority Hilditch Nickel target, located 25km from BHP's Kambalda Nickel Concentrator.

HILDITCH NICKEL TARGET

The Hilditch nickel target, 9km north of the Company's Wattle Dam Gold Mine, is defined by 300m long outcropping and sub-cropping, nickel-rich gossans. Shallow drilling of the target has returned promising results including 2m @ 2.4 % nickel from 73m (HRC025) and 4m at 1.8% nickel from only 25m down-hole (HRC052).

Historical shallow drilling of the target area returned promising nickel intersections (Figure 1) including:

- 2.0m @ 2.4% Ni, 0.5% Cu from 74.0m (HRC025)
- 4.0m @ 1.8% Ni, 0.5% Cu from 25.0m (HRC052)
- 2.0m @ 1.2% Ni from 1.0m (HRC002)
- 2.0m @ 1.0% Ni from 74m (HRC041).

FIXED LOOP ELECTROMAGNETIC SURVEYS

Geological review of the Hilditch nickel target highlights prospective structural and stratigraphic positions that require comprehensive geophysical assessment. With advancements of ground-based geophysics and modelling techniques, the application of modern high-powered electromagnetic survey is warranted.

The Fixed Loop Electromagnetic (FLEM) survey involves nine 1.9km lines spaced 100 metres apart and is designed to evaluate the geology to 500 metres depth (Figure 2). The survey also incorporates the recently drilled Hilditch West target, where assays from recent completed drilling are expected to be received mid July 2021.

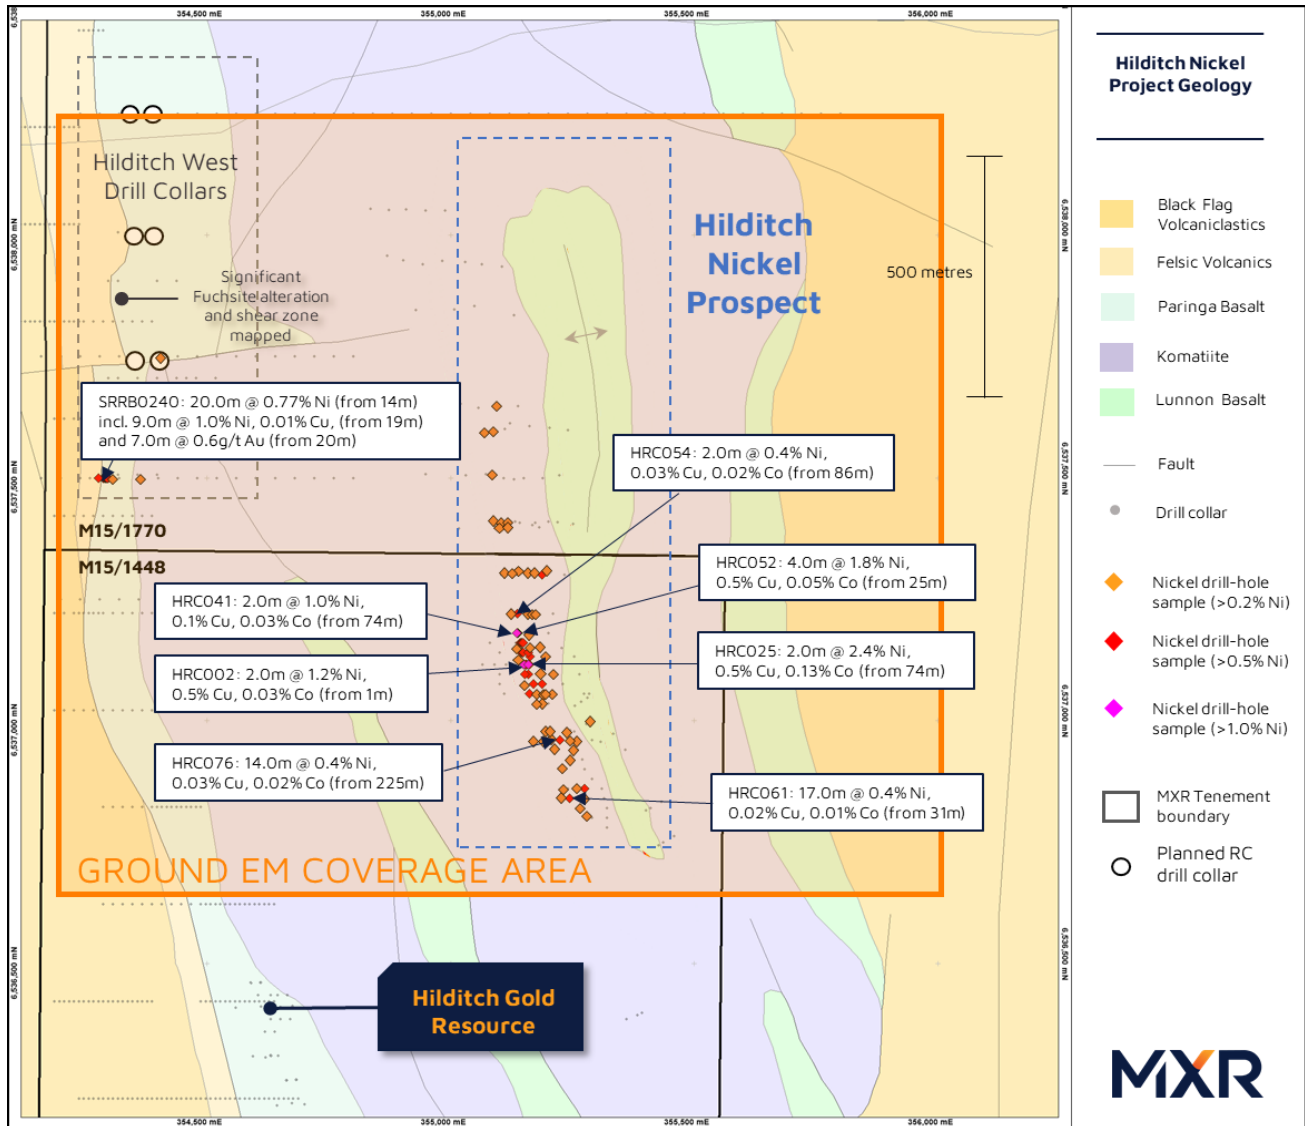

Figure 1- Hilditch Geology Map - showing Ground EM coverage and legacy drill intersections.

The FLEM survey is expected to be completed within seven days and interpretations to be received in following two weeks.

Ground based electromagnetic geophysics is an extremely useful tool in the exploration for nickel sulphide mineralisation due to the conductive response of sulphide minerals. Massive and semi-massive nickel mineralisation exhibit strong conductive signatures in contrast to surrounding geology.

Due to the high levels of exploration activity within Western Australia and demand for geophysical service providers, the planned geophysical programmes in the Spargoville Belt were delayed. EM surveys across the company's Central target is expected to be completed in the coming months, as the specialized SQUID equipment becomes available.

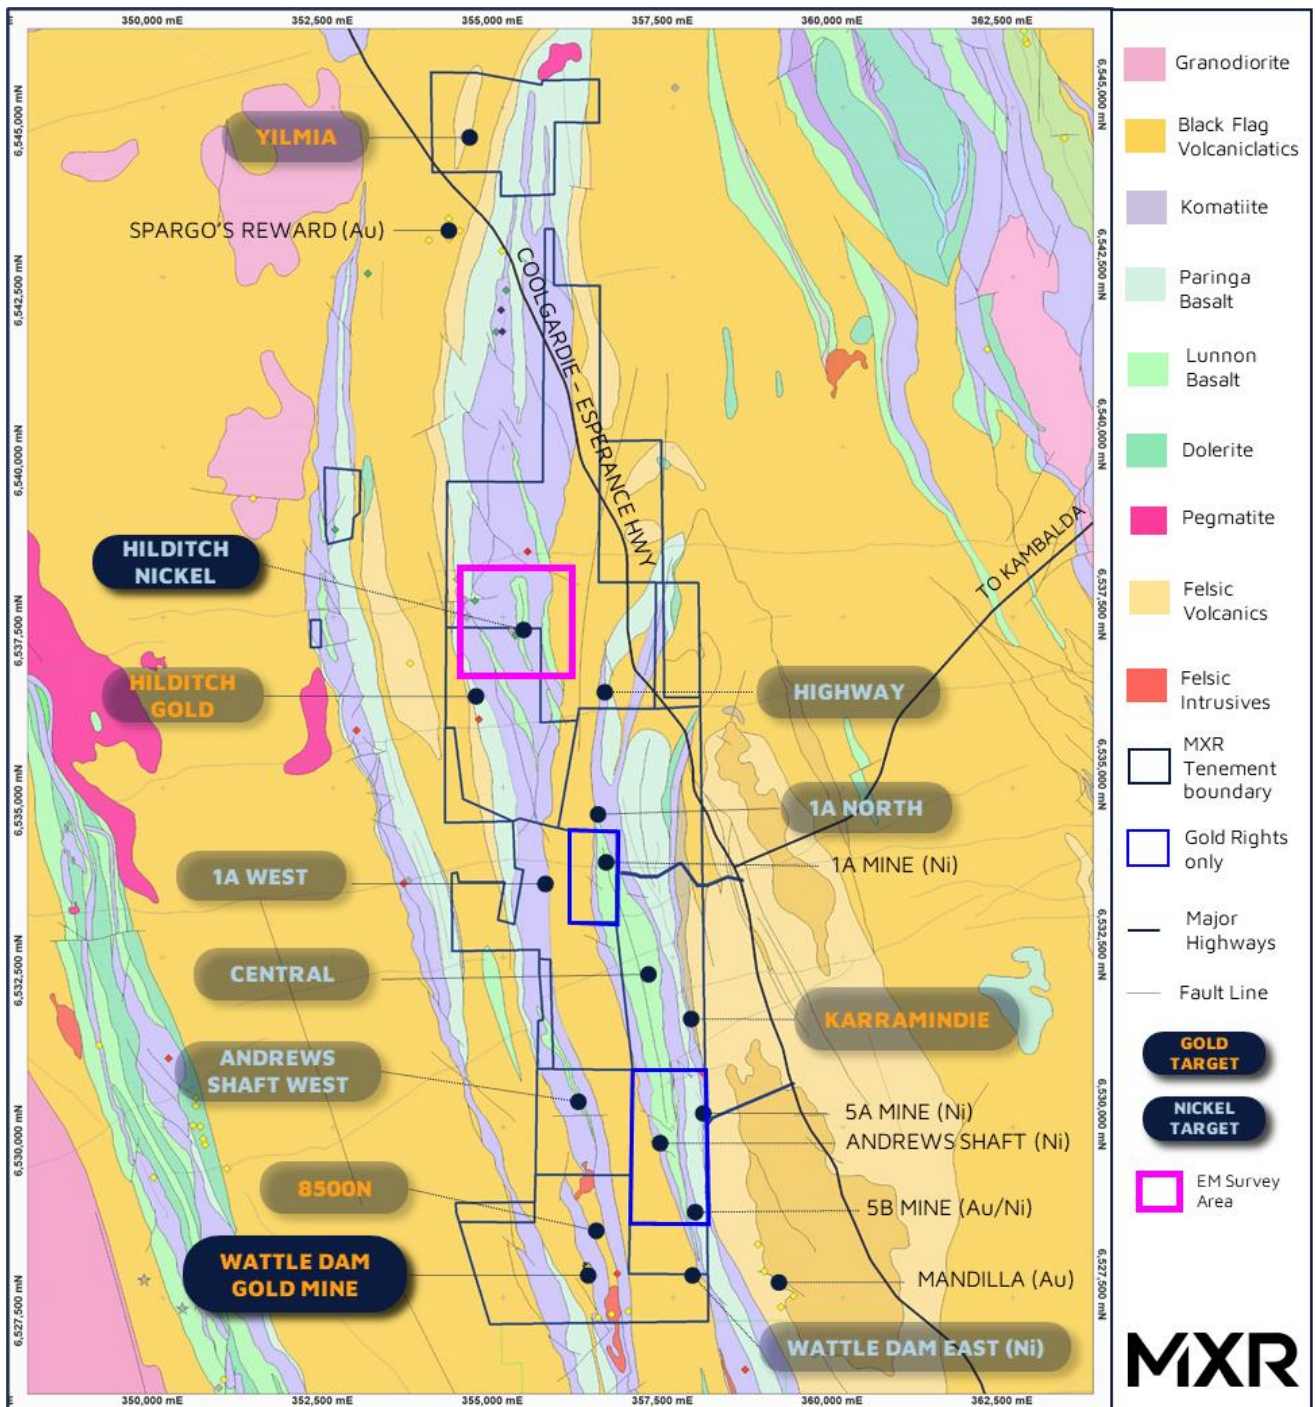

Figure 2 - Maximus Resource tenement map showing Hilditch location and EM coverage area.

This ASX announcement has been approved by the Board of Directors of Maximus.

ABOUT MAXIMUS RESOURCES

Maximus Resources (ASX:MXR) is a junior mining explorer with tenements located 20km from Kambalda, Western Australia's premier gold and nickel mining district. Maximus currently holds 48 sq km of tenements across the fertile Spargoville Shear Zone hosting the very high-grade Wattle Dam Gold Mine. Mined until 2012, Wattle Dam was one of Australia's highest-grade gold mines producing ~286,000oz @ 10.1g/t gold. Maximus is developing several small high-grade operations across the tenement portfolio, whilst actively exploring for the next Wattle Dam.

MXR's Spargoville tenements are highly prospective for Kambalda-style komatiite-hosted nickel sulphide mineralisation. A near contiguous belt of nickel deposits extends from Mincor Resources Limited's (ASX:MCR) Cassini nickel deposit to the south of the Neometals (ASX:NMT) Widgiemooltha Dome/Mt Edwards projects, through Estrella Resources (ASX:ESR) Andrews Shaft Nickel Deposit, to the northern extent of the Maximus tenement package, including Maximus' Wattle Dam East and Hilditch Nickel Prospects.

Competent Person Statement: The information in this announcement that relates to nickel prospectivity outlined within this document is based on information reviewed, collated and compiled by Dr Travis Murphy, a full-time employee of Maximus. Dr Murphy is a professional geoscientist and Member of The Australian Institute of Geoscientists and has sufficient experience relevant to the style of mineralisation and type of Deposit under consideration, and to the activity which has been undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources, and Ore Reserves. Dr Murphy consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears.

JORC Code, 2012 Edition

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> The database of soil-samples, auger holes, RAB, RC and diamond drill-holes for the Spargoville area has been compiled over several decades and via multiple owners. The database comprises unverified information coupled with recent drilling data with higher confidence. The method of collar survey is not known, however evidence for drilling activity (pads, piles of cuttings) are observed which correlate with the stored drill-hole data. Aircore and RC samples were collected at set nominal intervals and laid on the ground in rows. Details regarding the splitter arrangement and laboratory process are not available for the entirety of the legacy exploration database. The existing drilling data will be used as an indicator and will be followed-up using best practice drilling, sampling, QAQC, and assaying techniques.
Drilling techniques	<ul style="list-style-type: none"> Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> Within the Spargoville Project area, the dominant drilling method has been RAB, with few deeper RC holes as follow-up on selected anomalies. Diamond drill-holes are few and are concentrated proximal to the historic mines.
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> Not ascertained from the legacy dataset
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core 	<ul style="list-style-type: none"> Geological logging drillholes has been executed appropriately and captured in the drill-hole data base. Not all of the legacy drill-holes have complete logging datasets.

Criteria	JORC Code explanation	Commentary
	<p>(or costean, channel, etc) photography.</p> <ul style="list-style-type: none"> The total length and percentage of the relevant intersections logged. 	
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> Method of sample-splitting at the rig, in legacy drill-holes, is not known. Limited information is available for analytical techniques applied.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> Limited information is available for the utilised analytical technique. Limited information is available for the QAQC (standards and blanks) protocols applied.
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> Significant intersections have been verified for the current program by other Maximus employees. No aircore or RC holes have been twinned in the current program. No adjustments were made to assay data.
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> The method of collar survey/pick-up is not known, and assumed to be hand-held GPS for the majority of collars. The data is stored as grid system: MGA_GDA94 zone 51. Topographic control for the area requires validation.
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. 	<ul style="list-style-type: none"> Drill-hole spacing varies considerably across the tenement package. Further drilling of prospects with significant intersections may not necessarily result in definition of a mineral resource. No compositing is known to have occurred.

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> Whether sample compositing has been applied. 	
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Drill lines are oriented East-West and approximately perpendicular to the broadly North-South district-scale strike of prospective stratigraphy and structure. No sampling bias is believed to have been introduced.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> Not known for the legacy drill-hole data.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> No review or audit has been carried out.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary																																																																																																				
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<p>List of tenements held</p> <table border="1"> <thead> <tr> <th>Tenement No.</th> <th>Project</th> <th>Registered Holder</th> <th>Maximus Resources Interest</th> </tr> </thead> <tbody> <tr> <td colspan="4">Spargoville Project</td> </tr> <tr> <td>M 15 / 1475</td> <td>Eagles Nest</td> <td>Maximus Resources Ltd</td> <td>MXR - Criteria	JORC Code explanation	Commentary
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> The database is mostly comprised of work done by previous holders of the above listed tenements. Key nickel exploration activities were undertaken by Selcast (Australian Selection), Pioneer Resources, and Ramelious Resources.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> The styles of nickel mineralisation considered prospective in the tenement group includes: <ul style="list-style-type: none"> Kambalda-style komatiite-hosted sulfide mineralisation at the base of the ultramafic sequence Structurally controlled nickel-sulfide and/or gossan occurring within the ultramafic sequence. These may have gold and arsenic associations.
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<ul style="list-style-type: none"> No new drilling or sampling information is reported here (legacy information only), and information presented is intended to only demonstrate anomalous geochemistry for the company to follow-up with industry standard and documented drilling and sampling practices.
Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> Reported intercepts are simple averages where the sample lengths are length-weighted where combining samples of different length. Nickel, copper, and cobalt are reported separately and as such no metal equivalence calculation is employed.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	<ul style="list-style-type: none"> All reported intercepts are down-hole lengths in metres. At this early stage of initial drill-testing, there is insufficient information to ascertain accurate strike and dip of the mineralisation. As a result, the true width of mineralisation cannot be determined at present.

Criteria	JORC Code explanation	Commentary
<i>Diagrams</i>	<ul style="list-style-type: none"> • <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<ul style="list-style-type: none"> • A map indicating prospect and drill-hole locations is included in the body of the announcement
<i>Balanced reporting</i>	<ul style="list-style-type: none"> • <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> 	<ul style="list-style-type: none"> • Reported intercepts are considered anomalous in the context of early stage exploration activity.
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> • <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<ul style="list-style-type: none"> • This is an initial identification of early stage targets and no testwork of mineralised material has been conducted apart from routine assays.
<i>Further work</i>	<ul style="list-style-type: none"> • <i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> • <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> • Legacy mineralised intercepts will be assessed in the context of the imminent FLEM geophysical survey. • Any resultant conductive anomalies will be resolved against knowledge of the structure and stratigraphy of the prospect area, and follow-up programmes of work may include drilling as required.
