

## NEW CENTURY ACHIEVES A MAJOR INCREASE IN RESOURCE FOR THE CENTURY TAILINGS DEPOSIT

*100% Measured Resource of 78.9Mt at 3.02% zinc, 0.47% lead and 12.4g/t silver for a total contained metal content of 2,380,000t Zn, 370,000t Pb & 31,500,000oz Ag*

- Entire Century Tailings Deposit in the Measured Resource category
- 23% increase in total zinc metal content from previous Mineral Resource
- Measured Resource to be used as production basis for Restart Study, due Q4 2017
- Significant lead and silver metal content to provide potential by-product credits
- High-grade zones to provide potential increased production during initial operations
- The mining leases at Century now hold a Global contained metal Resource of over:
  - *2,600,000 tonnes of zinc*
  - *700,000 tonnes of lead*
  - *42,500,000 ounces of silver*

*Figure 1: Century Tailings Deposit looking South*

New Century Resources Limited (Company or New Century) (ASX:NCZ) is pleased to announce the results of the independently estimated Mineral Resource for the Century Tailings Deposit. The upgraded Mineral Resource was estimated by Optiro Pty Ltd which had also been responsible for the previous estimate for the Deposit.

Table 1: Upgraded JORC Code 2012 compliant Mineral Resource estimate for the Century Tailings Deposit

Resource Category	Tonnes (Mt)	Zinc (%)	Lead (%)	Silver (g/t)	Metal Content
Measured	78.9	3.02	0.47	12.4	2,380,000t zinc 370,000t lead 31,500,000oz silver

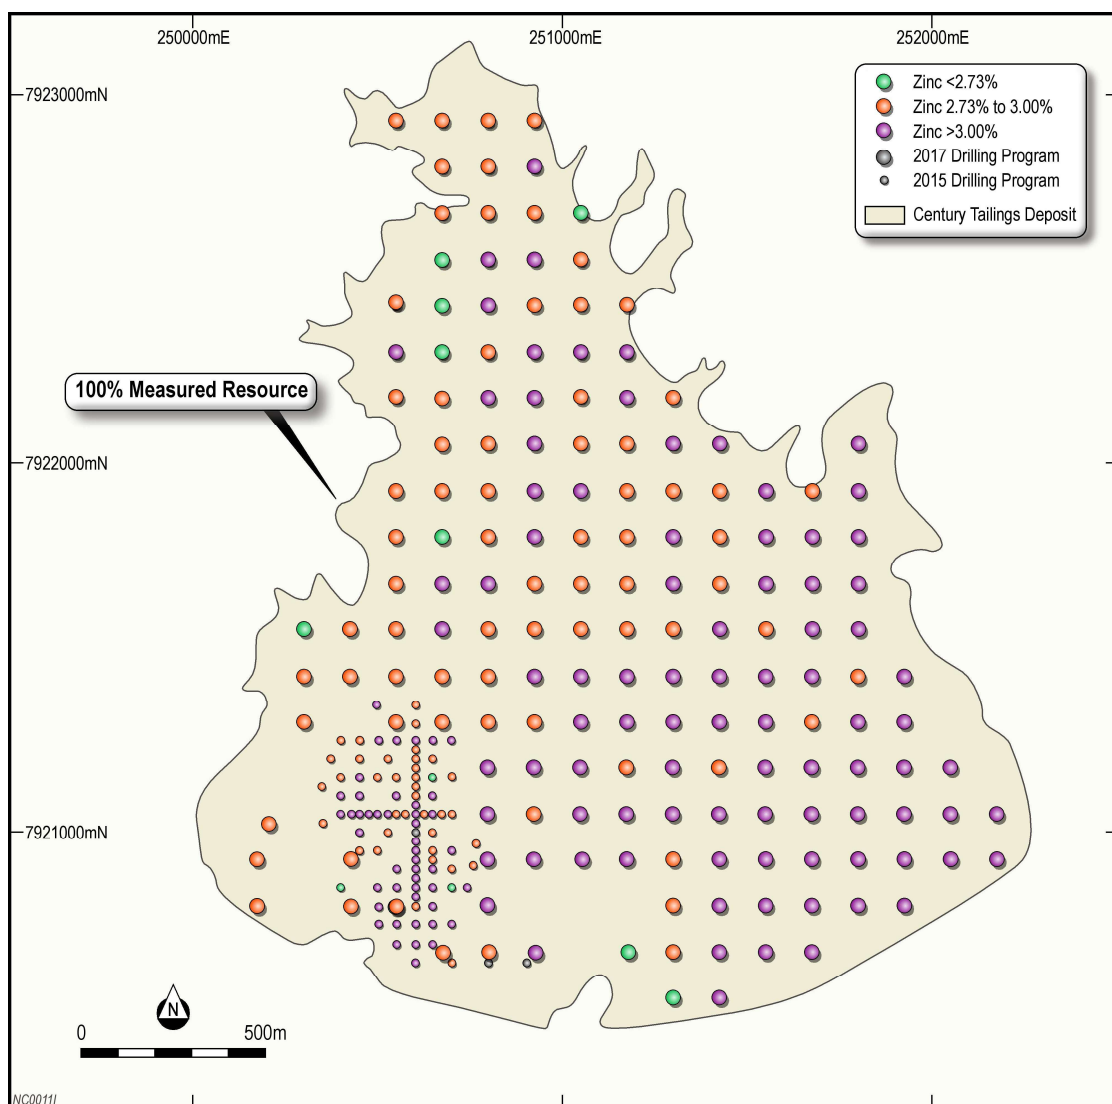

Figure 2: Plan view of the Century Tailings Deposit showing drilling programs

The previously reported estimate for the Century Tailings Deposit was an Indicated Resource of 12.8Mt at 2.97% zinc and an Inferred Resource of 58.2Mt at 2.68% zinc for a total 71Mt at 2.73% zinc (1,940,000t of contained zinc metal).

The upgraded estimate therefore represents:

- an 11% increase in total tonnes;
- an 11% increase in zinc metal grade;
- a 23% increase in total contained zinc metal;
- the first ever reporting of lead and silver in the Mineral Resource; and
- a 100% conversion of Indicated and Inferred Resources to a Measured Resource.

Commenting on the upgraded Mineral Resource, Managing Director Patrick Walta stated:

*“New Century is excited to announce this significant increase in metal content for the Century Tailings Deposit. The scale of this Measured Resource clearly provides an opportunity for substantial operations to be undertaken on site via the near term restart of the existing processing plant.*

*In addition, it is pleasing to see that resources at the Deposit have achieved a Measured Resource category, representing the highest confidence level possible under the JORC Code for Mineral Resource reporting. The Company is now targeting conversion of the new Resource to a Reserve as part of the Restart Study, which is due within the fourth quarter of 2017.”*

The Mineral Resource has been classified as Measured in accordance with the JORC Code (2012) due to the low variability and high confidence in all of the variables estimated. Furthermore, the comparison of the new Century Tailings Deposit block model grades (per year and per estimation domain) against the tailings stream grades from historical operations, representing many thousands of individual shift composite assays taken over the life of the mine, shows an overall difference of only 6%, well within the margin of error normally expected for a Measured Resource.

As shown in Figure 2, the entire Century Tailings Deposit is consistently mineralised, with a notable higher grade weighting toward the south-eastern corner of the Deposit. This is also the deepest part of the Deposit, with holes averaging ~20m depth, compared to a 13m Deposit average.

This higher grade zone provides an opportunity for increased zinc production during the initial years of operations and is planned to be targeted in the mine schedule as part of the Restart Feasibility Study currently underway by Sedgman (due to be completed in Q4 2017).

New Century is now finalising future production profiles based on the revised Mineral Resource and Sedgman’s investigations into the tailings throughput available within the existing Century Processing Plant.

The Global Mineral Resource at Century now stands at over 2,600,000t zinc, 700,000t lead and 42,500,000oz silver (see Table 2).

Table 2: JORC 2012 Compliant Resources of the Century Zinc Mine

Deposit	Tonnes (Mt)	Grade			Contained Metal		
		Zinc (%)	Lead (%)	Silver (g/t)	Zinc (t)	Lead (t)	Silver (oz)
Century Tailings <i>Measured</i>	78.9	3.02	0.47	12.4	2,380,000	370,000	31,500,000
Silver King <i>Inferred</i>	2.7	6.90	12.5	120	186,000	337,500	10,500,000
East Fault Block <i>Inferred</i>	0.5	11.6	1.10	48.0	60,000	5,500	800,000
<b>TOTAL</b>	<b>82.1</b>	<b>3.20</b>	<b>0.87</b>	<b>16.2</b>	<b>2,626,000</b>	<b>713,000</b>	<b>42,800,000</b>

### ***Geology and geological interpretation***

The deposit is a tailings dam with zinc, lead, and silver mineralisation deposited in sub horizontal layers as mine tailings sediment from up to five separate outflow sites.

### ***Sampling and sub-sampling techniques***

Quarter-core samples from the plastic, clay-like, tailings material were hand cut in the site laboratory at 1m intervals.

### ***Drilling techniques***

Drilling was carried out using a diamond drilling configuration utilising HQ3 diameter equipment.

### ***Sample analysis method***

Pulverized samples weighting 50-100g were sent to ALS Laboratory in Brisbane for analysis of Zn, Pb, Fe, S, SiO<sub>2</sub>, CaO, Al<sub>2</sub>O<sub>3</sub> and Mn by XRF, Ag by four acid digest with an ICP-AES finish, and Specific Gravity by pycnometer with methanol.

### ***Estimation methodology***

Estimation was completed in Datamine Studio RM using ordinary kriging (OK) into parent blocks of 100 mE by 100 mN by 1 mRL. Sub-celling down to 10 mE by 10 mN by 0.10 mRL was employed at domain boundaries for adequate volume resolution. The entire volume of the TSF was estimated using ordinary kriging.

### ***Criteria for classification***

The estimated portion of the Century Tailings Deposit Mineral Resource, constrained within a boundary string (defining the dam walls and excluding outflow areas), has been classified as

#### **Melbourne Office**

Suite 4, Level 9, 350 Collins Street, Melbourne VIC 3000

#### **Perth Office**

Suite 23, 513 Hay Street, Subiaco WA 6008

PO Box 1311, Subiaco WA 6904

**Phone** +61 (8) 6142 0989

**Email** info@newcenturyresources.com

**Website** www.newcenturyresources.com

Measured in accordance with the JORC Code (2012) due to the low variability and high confidence in all of the variables estimated.

The kriging estimation metrics (kriging efficiency and regression slope) indicate high-quality estimation; furthermore, the comparison of the model grades per year and per domain against the tailings stream grades, representing many thousands of individual shift composite assays taken over the life of the mine, shows an overall difference of 6%, well within the margin of error normally assumed for a Measured Resource.

### ***Cut off grades***

The Century Tailings Deposit has not been reported above a cut-off grade as it is anticipated that a selective mining method will not be used.

### ***Mining and metallurgical methods and parameters***

It is assumed that a bulk recovery, non-selective mining method, such as hydraulic mining, will be utilised.

Laboratory scale test work by New Century Resources shows potential zinc recoveries of up to 64% into a premium 50-53% Zn concentrate.

### ***Other modifying factors considered to date***

The project is fully permitted and economic viability is being assessed as part of the Restart Feasibility Study, due for completion in Q4 2017.

The Company is not aware of any reason why the ASX would not allow trading in the Company's securities to recommence immediately.

## **Competent Persons Statement**

The Mineral Resource statement for the Century Tailings Deposit has been compiled in accordance with the guidelines defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (2012 JORC Code).

The information in this report that relates to Mineral Resources at the Century Tailings Deposit is based on and fairly represents information compiled and overseen by Ian Glacken (FAusIMM(CP), FAIG, MIMMM, CEng), Principal Consultant of Optiro, who is acting as the Competent Person for this Mineral Resource update. Ian Glacken is a full-time employee of Optiro Pty Ltd.

Ian Glacken has sufficient experience in the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'.

A JORC 2012 Table 1 declaration is appended below for the Century Tailings Deposit.

The information in this announcement that relates to Mineral Resources (as that term is defined in the JORC Code) in respect to the Silver King Deposit and the East Fault Block Deposit was reported by the Company in its prospectus released to ASX on 20 June 2017. The Company confirms that it is not aware of any new information or data that materially affects the Silver King Deposit and the East Fault Block Deposit resource estimates, and that all material assumptions and technical parameters underpinning that estimate continue to apply and have not materially changed.

Appendix 1

**JORC Code, 2012 Edition – Table 1**

**Section 1 Sampling Techniques and Data**

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>A Sandvik 710 track mounted diamond drill rig was used to obtain whole drill-core samples</li> <li>Sample recovery and displacement were considered the primary risks to achieving representative sample across the deposit.</li> <li>Holes were dipped with a lead weighted rule following each 3m run to ensure the drilled interval matched the sampled void. Where recovery values were outside the predetermined range the hole would be re-drilled at the Geologists discretion.</li> <li>All drill sampling methods replicated those developed by MMG in 2015, and were run by the same Study Manager.</li> <li>The Tailings deposit by its nature is a wholly mineralized mass.</li> <li>All samples were HQ3 diameter core (61.1mm)</li> <li>Sampled intervals range from 0.3m to 1.3m around a nominal 1m sample size.</li> <li>Quarter-core samples were taken at the site laboratory for analysis. The remaining sample was retained and composited for detailed metallurgical testing.</li> <li>Samples weighing approximately 1-1.5kg were dried at 100C for 24 hours, crushed to ~3mm and split to 200g, then pulverized to 90% &lt; 53 microns</li> <li>Pulverized sample weighting 50-100g was then sent to ALS Laboratory in Brisbane for analysis of – Zn, Pb, Fe,S, SiO<sub>2</sub>, CaO, Al<sub>2</sub>O<sub>3</sub> &amp; Mn by XRF, Ag by four acid digest with an ICP-AES finish, and Specific Gravity by pycnometer with methanol.</li> <li>Pulverised reject material was retained on site for any further analytical requirements not identified at present time.</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type,</li> </ul>	<ul style="list-style-type: none"> <li>Drilling was carried out using a diamond drilling configuration</li> <li>Due to the unconsolidated nature of the tailings sediment, minor modifications were made to the drill-bit cutting face to improve penetration and subsequent sample recovery.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<i>whether core is oriented and if so, by what method, etc).</i>	<ul style="list-style-type: none"> <li>No water was added during the drilling process.</li> <li>Triple tube (HQ3) diameter equipment was used for all holes.</li> <li>All holes are vertical and do not require orientation.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> <li><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<ul style="list-style-type: none"> <li>Core recovery was measured for each 3m drill run or part thereof. Recovery was back allocated proportionately to pseudo 1m sections. This approach was adopted due to the plasticity and mobility of the sample medium. The dynamic characteristic of the sample reduces the confidence in the spatial origin of sample within the 3m run at times when 100% sample recovery is not achieved.</li> <li>Sample recovery was maximized through modification of the drilling practices. The drill-bit cutting face was tapered to improve penetration, the upper sequence was drilled within a poly-pipe casing to prevent lateral compression of the unconsolidated sediment, and no water was added during the sampling process. The process was developed, and extensively tested and validated during the 2015 campaign.</li> <li>From field observations, it is assumed that sample recovery is primarily impacted by the compaction and saturation state of the unconsolidated sediment. When the sediment is insufficiently compacted, or moisture levels reach saturation point, the sediment is no longer sufficiently competent to enter, or remain, in the sample tube. No direct relationship between sample recovery and grade has been identified - however the local dry bulk density should be reviewed to address the risk of over estimating contained metal in these areas.</li> <li>Average sample recovery was 93%</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></li> <li><i>The total length and percentage of the relevant intersections logged.</i></li> </ul>	<ul style="list-style-type: none"> <li>The tailings represent the unrecovered, homogenized, mineralized material from primary processing.</li> <li>No detailed logging of the tailings sediment is considered practicable.</li> <li>A total of 291 Drill holes, comprising of 3648m of drilling were used within the Century Tailings Mineral Resource estimate.</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></li> <li><i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i></li> <li><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></li> <li><i>Quality control procedures adopted for all sub-sampling stages to</i></li> </ul>	<ul style="list-style-type: none"> <li>Quarter-core samples from the plastic, clay-like, tailings material. were hand cut in the site laboratory</li> <li>Samples are considered of high quality, and the sample type and size are considered appropriate for the deposit type.</li> <li>Duplicate splits have been taken for analysis at the Boyd crusher to assess for variability.</li> <li>Previous analysis shows ~70% of the tailings is sized at &lt;38<math>\mu</math> due to the ultra-fine grind required</li> </ul>
